Convergence of a second-order energy-decaying method for the viscous rotating shallow water equation∗

Georgios Akrivis†, Buyang Li‡, and Jilu Wang§

Abstract. An implicit energy-decaying modified Crank–Nicolson time-stepping method is constructed for the viscous rotating shallow water equation on the plane. Existence, uniqueness and convergence of semidiscrete solutions are proved by using Schaefer’s fixed point theorem and $H^2$ estimates of the discretized hyperbolic–parabolic system. For practical computation, the semidiscrete method is further discretized in space, resulting in a fully discrete energy-decaying finite element scheme. A fixed-point iterative method is proposed for solving the nonlinear algebraic system. The numerical results show that the proposed method requires only a few iterations to achieve the desired accuracy, with second-order convergence in time, and preserves energy decay well.

Key words. Viscous shallow water equation, energy decay, modified Crank–Nicolson, error estimate.

1. Introduction. Let $\Omega \subset \mathbb{R}^2$ be a bounded domain with smooth boundary $\partial \Omega$. We consider an initial and boundary value problem for the rotating viscous shallow water equation

\begin{align}
\partial_t H &= -\nabla \cdot (Hu) \quad \text{in } \Omega \times (0, T], \\
\partial_t u &= -\nabla \left( \frac{1}{2} |u|^2 + g(H - H_b) \right) - (\nabla \times u + f) \hat{k} \times u + \mathcal{G}(H, u) \quad \text{in } \Omega \times (0, T],
\end{align}

subject to the following initial and homogeneous Dirichlet boundary conditions:

\begin{align}
u &= 0 \quad \text{on } \partial \Omega \times (0, T], \\
H|_{t=0} &= H^0 \quad \text{and } u|_{t=0} = u^0 \quad \text{in } \Omega,
\end{align}

where $H : \Omega \times [0, T] \to \mathbb{R}$ and $u = (u_1, u_2)^T : \Omega \times [0, T] \to \mathbb{R}^2$ denote the fluid thickness and velocity, respectively, and

\begin{equation}
\mathcal{G}(H, u) = \frac{\mu}{H} \nabla \cdot (H \nabla u) - c_f \frac{|u| u}{H}
\end{equation}

consists of the viscous and friction forces, with $|u|$ denoting the magnitude of the velocity $u$.

In the two-dimensional plane, $\nabla \times u := \frac{\partial u_2}{\partial x_1} - \frac{\partial u_1}{\partial x_2}$ denotes the curl of the vector field $u$, and $\hat{k} \times$ denotes the rotation operator that rotates a vector field counterclockwise by the angle $\pi/2$, i.e.,

$$\hat{k} \times \begin{pmatrix} v_1 \\ v_2 \end{pmatrix} = \begin{pmatrix} -v_2 \\ v_1 \end{pmatrix}.$$ 

The physical parameters and given functions in this model include

$g$: the gravity acceleration (positive constant)
\( f \): the Coriolis term (function)
\( \mu \): viscosity of the fluid (positive constant)
\( c_f \): Chezy coefficient for the bottom friction (positive constant)
\( H_b \): the bathymetry (time-independent function).

The shallow water equations (1.1)–(1.2) describe the evolution of an incompressible fluid in response to gravitational and rotational accelerations for small enough ratio between the vertical and the horizontal scales. They are typically used to describe vertically averaged flows in three-dimensional domains in terms of horizontal velocity and depth variation. For smooth initial data such that \( H^0 - H_b \) and \( u^0 \) are sufficiently small, it is known that the initial and boundary value problem (1.1)–(1.4) possesses a unique global smooth solution such that \( H > 0 \); cf. [27, 25, 26].

The numerical solution of the shallow water equation has wide applications in ocean modeling to study tidal fluctuations caused by earthquakes and storms, and to study allowable discharge allocations by industries for water quality control. A nice introduction to the mathematical and computational modeling of ocean circulation, with a detailed derivation of the governing PDEs and an overview of early computational developments for such problems, is given in [14].

Many efforts have been devoted in developing efficient numerical methods and analyzing stability and convergence of numerical solutions for the shallow water equation. The energy boundedness of several first-order time-stepping methods for the viscous shallow water equation is proved in [1]. Convergence of numerical solutions to the viscous shallow water equation is established in [8] and [9] for a semidiscrete finite element method (FEM) and a fully discrete FEM, respectively, for a wave shallow water model proposed in [18]. The fully discrete FEM in [9] is linearly implicit and first-order in time, and was shown to be convergent under a grid-ratio condition \( \tau = O(h) \), which was used to prove the \( L^\infty \) boundedness of numerical solutions via an inverse inequality for finite element functions. Convergence of a fully discrete, first-order in time, nonlinearly implicit characteristic method for the shallow water equation is shown in [11], also under the grid-ratio condition \( \tau = O(h) \) for the same reason. A leap-frog FEM is considered in [28] for the viscous shallow water equation on the unit sphere, and an error estimate is derived under the same grid-ratio condition \( \tau = O(h) \). Exponential time differencing methods for the shallow water equations are constructed, discussed and implemented in the recent paper [21]. Rigorous proof of convergence of the exponential time differencing method is still open.

Convergence of a Galerkin FEM with explicit Runge–Kutta methods in time is proved for the hyperbolic shallow water equation in one space dimension in [3] and [4]. Optimal-order error estimates are established under the hyperbolic CFL condition \( \tau = O(h) \). For an overview of numerical methods for the nonlinear hyperbolic shallow water equations and related models, with the main emphasis on the spatial discretization and on practical issues, as well as for references to the original literature, we refer to the recent review paper [30].

Since the energy of the solutions to the viscous shallow water equation alway decays in time, it is desirable to preserve this property in numerical solutions. Some high-order well-balanced and energy-conserving explicit methods have been constructed for the hyperbolic shallow water equation; for example, see [6, 7, 19, 31]. For the viscous shallow water equation, these explicit methods would preserve energy decay but require a CFL condition \( \tau = O(h^2) \). As far as we know, no implicit methods have been reported to preserve energy decay for the viscous shallow water equation without requiring a CFL condition. Therefore, the construction of energy-decaying numerical methods (especially second-order methods without CFL conditions) for viscous shallow water equations is still challenging.

As far as we know, all existing error analyses of implicit and linearly implicit time-stepping methods for the viscous shallow water equation require the grid-ratio condition \( \tau = O(h) \), which
In this section, we present a second-order implicit method. Otherwise the semi-discretization in time (corresponding to the case \( h \to 0 \) in the full discretization) may not converge with optimal order. The grid-ratio condition was used to prove the \( L^\infty \) boundedness of numerical solutions by an inverse inequality of finite element functions, which may be avoided if (i) convergence of the semi-discretization method in the \( H^2 \) norm with respect to the time stepsize can be established, (ii) the error splitting approach in [16, 17, 29] can be adopted for analysis of the fully discrete FEM (this approach requires the temporal semi-discrete solutions to be bounded in the \( H^2 \) norm uniformly in temporal stepsizes).

In this paper, we propose a second-order energy-decaying modified Crank–Nicolson method for the viscous problem (1.1)–(1.4) and establish (i), i.e., optimal-order convergence of the semi-discretization method in the \( H^2 \) norm with respect to the time stepsize. This would provide a foundation for error analysis of fully discrete FEMs using the approach mentioned in (ii) without a grid-ratio condition. The analysis of \( H^2 \) convergence of the proposed nonlinearly implicit temporal semi-discretization for the hyperbolic–parabolic system (1.1)–(1.4) is different from all existing work using the error splitting approach, e.g., [16, 17, 29], which all concern only nonlinear parabolic equations and linearly semi-implicit schemes. The derivation of the error estimates in this paper is based on the boundedness of the numerical solutions in \( H^2(\Omega) \) (uniformly with respect to the stepsize \( \tau \)), proved by Schaefer’s fixed-point theorem, combined with discrete \( L^\infty(0, T; H^2(\Omega)) \) and \( L^2(0, T; H^3(\Omega)) \) estimates of the Crank–Nicolson scheme.

2. Energy decay and time discretization. In this section, we present a second-order implicit modified Crank–Nicolson method preserving the energy decay property of the viscous shallow water equation.

2.1. Energy decay property. Testing (1.1) by \( \frac{1}{2}|u|^2 + g(H - H_b) \) and (1.2) by \( Hu \), we obtain

\[
\int_\Omega \partial_t H \left( \frac{1}{2}|u|^2 + g(H - H_b) \right) dx = -\int_\Omega \nabla \cdot (Hu) \left( \frac{1}{2}|u|^2 + g(H - H_b) \right) dx
\]

and

\[
\int_\Omega \partial_t u \cdot (Hu) dx = -\int_\Omega \nabla \left( \frac{1}{2}|u|^2 + g(H - H_b) \right) \cdot (Hu) dx + \int_\Omega \mathcal{G}(H, u) \cdot (Hu) dx,
\]

respectively, where we used the orthogonality \((\hat{k} \times u) \cdot (Hu) = 0\) in the derivation of (2.2). By adding the relations (2.1) and (2.2), the first terms on their right-hand sides cancel, while the first terms on their left-hand sides can be combined using the product rule of differentiation. Therefore, we obtain

\[
\frac{d}{dt} \int_\Omega \frac{1}{2} \left( |u|^2 H + g(H - H_b)^2 \right) dx = \int_\Omega \mathcal{G}(H, u) \cdot (Hu) dx.
\]

We infer that the energy \( E(u, H) \),

\[
E(u, H) := \int_\Omega \frac{1}{2} \left( |u|^2 H + g(H - H_b)^2 \right) dx,
\]

satisfies the relation

\[
\frac{d}{dt} E(u, H) = \int_\Omega \mathcal{G}(H, u) \cdot (Hu) dx = -\mu \int_\Omega H |\nabla u|^2 dx - cf \int_\Omega |u|^3 dx \leq 0
\]

if \( H > 0 \), where we have used the expression of \( \mathcal{G}(H, u) \) in (1.5) and integration by parts. This shows that the energy is decaying.
2.2. A modified Crank–Nicolson method. Let \( t_n := n\tau, \) \( n = 0, 1, \ldots, N, \) be the nodes of a uniform partition of the time interval \([0, T]\) with stepsize \( \tau = T/N, \) and denote

\[
\partial_t v^n := (v^n - v^{n-1})/\tau \quad \text{and} \quad v^{n-\frac{1}{2}} := (v^n + v^{n-1})/2.
\]

We consider the temporal discretization of the initial and boundary value problem (1.1)–(1.2) by the following implicit scheme: for given \( H^n \in H^1(\Omega) \) and \( u^{n-1} \in [H^2(\Omega) \cap H^1_0(\Omega)]^2, \) find \( H^n \in H^1(\Omega) \) and \( u^n \in [H^2(\Omega) \cap H^1_0(\Omega)]^2 \) satisfying the following equations:

\[
\begin{aligned}
\partial_t H^n &= -\nabla \cdot (H^{n-\frac{1}{2}} u^{n-\frac{1}{2}}), \\
\partial_t u^n &= -\nabla \left( \frac{1}{4} (|u^n|^2 + |u^{n-1}|^2) + g(H^{n-\frac{1}{2}} - H_b) \right) \\
&\quad - (\nabla \times u^{n-\frac{1}{2}} + f^{n-\frac{1}{2}}) \times u^{n-\frac{1}{2}} + \mathcal{G}(H^{n-\frac{1}{2}}, u^{n-\frac{1}{2}}), \quad n = 1, \ldots, N,
\end{aligned}
\]

(2.6)

with starting values \( H^0 \) and \( u^0 \) being the given initial values in (1.4).

In the standard Crank–Nicolson method, the term \(|u|^2\) in (1.2) would be discretized in the form \(|u^{n-\frac{1}{2}}|^2\); instead, in the second equation of (2.6), we discretized it by \((|u^n|^2 + |u^{n-1}|^2)/2; \) this modification of the Crank–Nicolson method is familiar from [24] for the nonlinear Klein–Gordon equation and from [12] for the nonlinear Schrödinger equation; see also [2].

A different type of modified Crank–Nicolson method was also used for preserving the energy decay property of the Cahn–Hilliard equation; see [22].

2.3. Energy decay of discrete solutions.

Theorem 2.1. If \((H^n, u^n) \in H^1(\Omega) \times [H^2(\Omega) \cap H^1_0(\Omega)]^2, n = 1, \ldots, N,\) is a solution of (2.6) satisfying

\[
H^n > 0, \quad n = 1, \ldots, N,
\]

then the modified Crank–Nicolson scheme (2.6) is energy-decaying, i.e.,

\[
E(u^n, H^n) \leq E(u^{n-1}, H^{n-1}), \quad n = 1, \ldots, N.
\]

Proof. Testing the first equation in (2.6) by \( \frac{1}{4}(|u^n|^2 + |u^{n-1}|^2) + g(H^{n-\frac{1}{2}} - H_b) \) and the second by \( H^{n-\frac{1}{2}} u^{n-\frac{1}{2}}, \) adding the results, and noticing that, as in the continuous case, the first terms on the right-hand sides cancel, and the second term on the right-hand side of the second relation vanishes due to the orthogonality \( (\mathcal{G}(H^{n-\frac{1}{2}}, u^{n-\frac{1}{2}}), (H^{n-\frac{1}{2}} u^{n-\frac{1}{2}})) = 0, \)

\[
\int_{\Omega} \theta_x H^n \left( \frac{1}{4} (|u^n|^2 + |u^{n-1}|^2) + g(H^{n-\frac{1}{2}} - H_b) \right) + \mathcal{G}(H^{n-\frac{1}{2}}, u^{n-\frac{1}{2}}) \, dx
\]

(2.8)

Then, substituting the identities

\[
\begin{aligned}
\partial_t u^n \cdot (H^{n-\frac{1}{2}} u^{n-\frac{1}{2}}) &= \frac{1}{2\tau} H^n - \frac{1}{2} (|u^n|^2 - |u^{n-1}|^2) \\
&= \frac{1}{4\tau} (H^n |u^n|^2 - H^{n-1} |u^{n-1}|^2) + \frac{1}{4\tau} (H^{n-1} |u^n|^2 - H^n |u^{n-1}|^2),
\end{aligned}
\]

\[
\begin{aligned}
\partial_t H^n \frac{1}{4} (|u^n|^2 + |u^{n-1}|^2) &= \frac{1}{4\tau} (H^n |u^n|^2 - H^{n-1} |u^{n-1}|^2) - \frac{1}{4\tau} (H^{n-1} |u^n|^2 - H^n |u^{n-1}|^2),
\end{aligned}
\]

\[
\begin{aligned}
\partial_t H^n g(H^{n-\frac{1}{2}} - H_b) &= \frac{g}{2\tau} [(H^n - H_b)^2 - (H^{n-1} - H_b)^2],
\end{aligned}
\]

and the result follows by an energy estimate.
into (2.8), we obtain
\[
\int_{\Omega} \frac{1}{2} (H^n|u|^2 + g(H^n - H_b)^2) \, dx = \int_{\Omega} \frac{1}{2} (H^{n-1}|u|^{n-1} + g(H^{n-1} - H_b)^2) \, dx \\
+ \tau \int_{\Omega} G(H^{n-\frac{1}{2}}, u^{n-\frac{1}{2}}) \cdot (H^{n-\frac{1}{2}}u^{n-\frac{1}{2}}) \, dx.
\]

By using the expression (1.5) of the viscous and friction forces, we have
\[
\int_{\Omega} G(H^{n-\frac{1}{2}}, u^{n-\frac{1}{2}}) \cdot (H^{n-\frac{1}{2}}u^{n-\frac{1}{2}}) \, dx = -\int_{\Omega} (\mu H^{n-\frac{1}{2}}|\nabla u^{n-\frac{1}{2}}|^2 + c_f|u^{n-\frac{1}{2}}|^3) \, dx \leq 0.
\]
This implies the energy decay property (2.7).

For practical computation, the semi-discrete scheme (2.6) can be further discretized in space by the FEM: find \((H^n_h, u^n_h) \in S_h \times \tilde{S}^2_h\), where \(S_h \subset H^1_0(\Omega)\), satisfying the weak formulation
\[
\begin{align*}
(\partial_t H^n_h, \phi_h) - (H^{n-\frac{1}{2}}u^{n-\frac{1}{2}}, \nabla \phi_h) &= 0, \quad \forall \phi_h \in S_h, \\
(\partial_t u^n_h, H^{n-\frac{1}{2}}v_h) + (\mu H^{n-\frac{1}{2}}\nabla u^{n-\frac{1}{2}}, \nabla v_h) + (c_f|u^{n-\frac{1}{2}}|^2, v_h) \\
&= -\left( \nabla P_h \left[ \frac{1}{4} (|u^n_h|^2 + |u^{n-1}_h|^2) + g(H^{n-\frac{1}{2}} - H_b) \right], H^{n-\frac{1}{2}}v_h \right) \\
&+ \left( (\nabla \times u^{n-\frac{1}{2}} + f^{n-\frac{1}{2}})e \times u^{n-\frac{1}{2}}, H^{n-\frac{1}{2}}v_h \right) \quad \forall v_h \in \tilde{S}^2_h
\end{align*}
\]
with starting values \(H^n_0\) and \(u^n_0\) being the Lagrange interpolants of \(H^0\) and \(u^0\), respectively. Here, \(S_h\) and \(\tilde{S}^2_h\) are the scalar- and vector-valued finite element spaces, respectively, consisting of globally continuous piecewise linear polynomials. The \(L^2\)-projection \(P_h\) onto the finite element space \(S_h\) in (2.9) ensures that the energy decay property is unconditionally preserved also in the fully discrete case. The proof proceeds along the lines of the proof of Theorem 2.1, i.e., substituting
\[
\phi_h = P_h \left[ \frac{1}{4} (|u_0^n|^2 + |u^{n-1}_0|^2) + g(H^{n-\frac{1}{2}} - H_b) \right] \quad \text{and} \quad v_h = u^{n-\frac{1}{2}}
\]
into (2.9) and summing up the two equations, we obtain
\[
\int_{\Omega} \frac{1}{2} (H^n_h|u^n_h|^2 + g(H^n_h - H_b)^2) \, dx = \int_{\Omega} \frac{1}{2} (H^{n-1}_h|u^{n-1}_h|^2 + g(H^{n-1}_h - H_b)^2) \, dx \\
- \int_{\Omega} (\mu H^{n-\frac{1}{2}}|\nabla u^{n-\frac{1}{2}}|^2 + c_f|u^{n-\frac{1}{2}}|^3) \, dx \\
\leq \int_{\Omega} \frac{1}{2} (H^{n-1}_h|u^{n-1}_h|^2 + g(H^{n-1}_h - H_b)^2) \, dx,
\]
which holds whenever \(H^{n-\frac{1}{2}} \geq 0\). This proves the energy decay property of the fully discrete FEM.

2.4. Existence, uniqueness and convergence of discrete solutions. For simplicity, we denote by \((\cdot, \cdot)\) and \(
\| \cdot \|\) the inner products and norms on both \(L^2(\Omega)\) and \((L^2(\Omega))^2\), by \(\| \cdot \|_{H^m}\) the norms on \(H^m(\Omega)\) and on \((H^m(\Omega))^2\), and similarly for norms on \(L^p(\Omega)\)-based Sobolev spaces.

We assume that
(A1) The domain \(\Omega\) is sufficiently smooth, and the solution \((H, u)\) of the initial and boundary value problem (1.1)–(1.4) is sufficiently smooth.
(A2) The solution of (1.1)–(1.4) satisfies
\[
\inf_{(x,t) \in \bar{H} \times [0,T]} H(x, t) \geq H_{\min} \quad \text{for some positive constant } H_{\min}.
\]
We denote by $B_{H,u}^n$ the set of pairs $(\tilde{H}, \tilde{u}) \in H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2$ such that
\begin{equation}
\|H - H(t_n)\|_{H^2} + \|H - H(t_n)\|_{L^\infty} \leq \frac{H_{\text{min}}}{2} \quad \text{and} \quad \|\tilde{u} - u(t_n)\|_{H^3} \leq 1,
\end{equation}
where $H(t_n) := H(\cdot,t_n)$ and $u(t_n) := u(\cdot,t_n)$ are the exact solutions at the time level $t = t_n$. Thus $B_{H,u}^n$ is a neighborhood of the solution $(H(t_n), u(t_n))$ in the space $H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2$.

The main theoretical result of this paper is

**Theorem 2.2.** Under assumptions (A1)–(A2), there exists a positive constant $\tau_0$ such that, for $\tau \leq \tau_0$, the modified Crank–Nicolson method (2.6) has a unique solution $(H^n, u^n) \in B_{H,u}^n$ for $n = 1, \ldots, N$. Moreover, the solution satisfies the following error estimate:
\begin{equation}
\max_{1 \leq n \leq N} \left( \|H(t_n) - H^n\|_{H^2} + \|u(t_n) - u^n\|_{H^2} + \left( \sum_{n=1}^N \|u(t_n - \frac{\tau}{2}) - u^n - \frac{\tau}{2}\|_{H^2}^2 \right)^{\frac{1}{2}} \right) \leq C \tau^2,
\end{equation}
with a constant $C$ independent of $\tau$.

**Remark 2.3.** An immediate consequence of Theorem 2.2 is that the discrete solution satisfies, for $\tau \leq \tau_0$,
\begin{equation}
\|H^n\|_{H^2} + \|u^n\|_{H^1} + \|u^n - u^{n-1}\|_{H^2}/\tau \leq C.
\end{equation}
This result can be used for error analysis of fully discrete FEMs, which can be viewed as the spatial discretization of the semidiscrete problem (2.6), whose solution has regularity (2.12). By utilizing this regularity result (uniformly in the stepsize $\tau$), one can expect that the error between semidiscrete and fully discrete solutions has the following bound:
\begin{equation}
\|H^n - H_h^n\| + \|u^n - u_h^n\| \leq C h^2,
\end{equation}
with a right-hand side independent of $\tau$. Such type of error estimates (independent of $\tau$) have been proved in [17, 16, 29] for many nonlinear parabolic and wave equations. With such results as (2.13), convergence and boundedness of fully discrete numerical solutions in $L^\infty(0,T; L^\infty(\Omega))$ can be proved, for $\tau \leq \tau_0$ and $h \leq h_0$, by using (2.13) and an inverse inequality, without requiring any grid-ratio condition.

3. **Proof of Theorem 2.2.** In this section, we prove existence and uniqueness of discrete solutions for sufficiently small time stepsize $\tau$, and establish a second-order error estimate.

3.1. **$H^2$ and $H^3$ estimates for the Crank–Nicolson scheme.** In this subsection, we present some $H^2$ and $H^3$ estimates of the Crank–Nicolson scheme for the heat equation, which will be used in our error estimation for the shallow water equation. Our main tool will be the following resolvent estimates:

**Lemma 3.1 (Resolvent estimates).** The Dirichlet Laplacian operator $\Delta : H^2(\Omega) \cap H^1_0(\Omega) \to L^2(\Omega)$ satisfies the resolvent estimates
\begin{align}
\|\Delta(z - \Delta)^{-1}f\|_{L^2} &\leq C\|f\|_{L^2} \quad \text{if} \ f \in L^2(\Omega), \ z \in \mathbb{C} \ \text{and} \ \text{Re} \ z \geq 0, \\
\|\Delta(z - \Delta)^{-1}f\|_{H^1} &\leq C\|f\|_{H^1} \quad \text{if} \ f \in H^1(\Omega), \ z \in \mathbb{C} \ \text{and} \ \text{Re} \ z \geq 0,
\end{align}
with a constant $C$ independent of $z$.

**Proof.** It is well known that the Dirichlet Laplacian $\Delta : H^2(\Omega) \cap H^1_0(\Omega) \to L^2(\Omega)$ generates a bounded analytic semigroup on $L^2(\Omega)$; see [20]. Equivalently, $z - \Delta$ is invertible for $z \in \mathbb{C}$ such that $\text{Re} \ z \geq 0$ and the resolvent estimate (3.1) holds; see [5, Example 3.7.5 and Theorem 3.7.11].
For $f \in H^1_0(\Omega)$,
\[
\|\Delta (z - \Delta)^{-1} f\|_{H^1} = \|(-\Delta)^{\frac{1}{2}} (z - \Delta)^{-1} (-\Delta)^{\frac{1}{2}} f\|_{H^1}
\leq\|\Delta (z - \Delta)^{-1} (-\Delta)^{\frac{1}{2}} f\|_{L^2}
\leq C\|(-\Delta)^{\frac{1}{2}} f\|_{L^2} \leq C\|f\|_{H^1},
\]
where we have used (3.1) in the second to last inequality. This proves (3.2) for $f \in H^1_0(\Omega)$.

For $f \in H^1(\Omega)$, we choose a sequence of functions $f_n = e^{n^{-1}\Delta} f \in H^1_0(\Omega)$, $n \in \mathbb{N}$. Then $f_n$ is the solution of the heat equation at time $t = 1/n$ with initial value $f$, satisfying the following standard estimate:
\[
(3.3) \quad f_n \to f \text{ in } L^2(\Omega) \text{ as } n \to \infty \text{ and } \|f_n\|_{H^1} \leq C\|f\|_{H^1}.
\]
In fact, we have $f_n = e^{n^{-1}\Delta} f \to f$ in $L^2(\Omega)$ because the heat semigroup is strongly continuous (and analytic) on $L^2(\Omega)$; see [20, Theorem 2.4]. The estimate $\|f_n\|_{H^1} \leq C\|f\|_{H^1}$ can be proved as follows: let $v$ be the solution of the heat equation
\[
\partial_t v - \Delta v = 0 \quad \text{with initial condition } v(\cdot, 0) = f \in H^1(\Omega),
\]
so that $f_n = v(\cdot, 1/n)$. Then, testing this equation by $\partial_t v$ yields
\[
\|\partial_t v\|^2_{L^2} + \frac{d}{dt} \left( \frac{1}{2} \|\nabla v\|^2_{L^2} \right) = 0,
\]
which implies $\|\nabla v(\cdot, t)\|_{L^2} \leq \|\nabla v(\cdot, 0)\|_{L^2}$. This proves that $\|\nabla f_n\|_{L^2} \leq \|\nabla f\|_{L^2}$, and, together with the standard $L^2$ stability estimate $\|f_n\|_{L^2} \leq \|f\|_{L^2}$, lead to $\|f_n\|_{H^1} \leq \|f\|_{H^1}$.

Since (3.2) holds for $f_n \in H^1_0(\Omega)$, it follows that
\[
(3.4) \quad \|\Delta (z - \Delta)^{-1} f_n\|_{H^1} \leq C\|f_n\|_{H^1} \leq C\|f\|_{H^1}.
\]
This proves that $\Delta (z - \Delta)^{-1} f_n$ is bounded in $H^1(\Omega)$. On the one hand, there exists a subsequence $\Delta (z - \Delta)^{-1} f_{n_k}$ which converges weakly in $H^1(\Omega)$. On the other hand, $\Delta (z - \Delta)^{-1} f_{n_k}$ converges strongly in $L^2(\Omega)$, because $f_{n_k} \to f$ in $L^2(\Omega)$ and $\Delta (z - \Delta)^{-1}$ is a bounded linear operator on $L^2(\Omega)$. Thus $\Delta (z - \Delta)^{-1} f_{n_k}$ converges weakly in $H^1(\Omega)$ to $\Delta (z - \Delta)^{-1} f$. Then (3.4) implies (cf. [10, Theorem 5.12.2])
\[
\|\Delta (z - \Delta)^{-1} f\|_{H^1} \leq \lim \inf_{n_k \to \infty} \|\Delta (z - \Delta)^{-1} f_{n_k}\|_{H^1} \leq C\|f\|_{H^1},
\]
where we have used (3.4) in the last inequality. This proves the desired results.

**Lemma 3.2.** For a given sequence $(f^n)_{n \in \mathbb{N}} \subset H^s(\Omega)$, with $s \in \{0, 1\}$, and starting value $v^0 = 0$ in $\Omega$, consider the sequence $(v^n)_{n \in \mathbb{N}}$, with $v^n \in H^1_0(\Omega)$, satisfying
\[
(3.5) \quad \partial_t v^n - \Delta v^{n-\frac{1}{2}} = f^n \quad \text{in } \Omega, \quad n \in \mathbb{N}.
\]
Then, there exists a positive constant $C$, independent of $\tau$ and of the sequence $(f^n)_{n \in \mathbb{N}}$, such that, for any $m \in \mathbb{N},$
\[
(3.6) \quad \max_{1 \leq n \leq m} \|v^n\|^2_{H^{1+s}} + \tau \sum_{n=1}^m \|v^{n-\frac{1}{2}}\|^2_{H^{2+s}} \leq C\tau \sum_{n=1}^m \|f^n\|^2_{H^s}.
\]
**Proof.** Without loss of generality, we assume that $f^n = 0$ for $n \geq m + 1$. Otherwise we set $f^n = 0$ for $n \geq m + 1$ without affecting the value of $v^n$ for $n \leq m$. Then $f = (f^n)_{n \in \mathbb{Z}}$ is an $L^2(\Omega)$-valued square summable sequence.

Let $v = (v^n)_{n=1}^\infty$ and $f = (f^n)_{n=1}^\infty$, and denote by $\mathcal{F}$ the Fourier $\mathbb{Z}$-transform, which transforms
a square summable sequence $f = (f^n)_{n \in \mathbb{Z}}$ to a function

$$\mathcal{F} f(\zeta) = \sum_{n \in \mathbb{Z}} \zeta^n f^n$$

defined a.e. for $\zeta$ on the unit disk $\mathbb{D}$ on the complex plane.

Multiplying (3.5) by $\zeta^n$ and summing up the equations for $n = 1, 2, \ldots$, we obtain

(3.7)

$$\left( \frac{1 - \zeta}{\tau} - \frac{1 + \zeta}{2} \Delta \right) \mathcal{F} v(\zeta) = \mathcal{F} f(\zeta),$$

which furthermore implies

$$\frac{1 + \zeta}{2} \Delta \mathcal{F} v(\zeta) = \Delta \left( \frac{2}{\tau} \frac{1 - \zeta}{1 + \zeta} - \Delta \right)^{-1} \mathcal{F} f(\zeta)$$

and therefore (taking the inverse transform of $\mathcal{F}$)

(3.8)

$$(\Delta v_n^{-\frac{1}{2}})_{n=1}^{\infty} = \mathcal{F}^{-1} M(\zeta) \mathcal{F} (f^n)_{n=1}^{\infty},$$

where $M(\zeta) = \Delta \left( \frac{2}{\tau} \frac{1 - \zeta}{1 + \zeta} - \Delta \right)^{-1}$.

Since $\text{Re} \left( \frac{2}{\tau} \frac{1 - \zeta}{1 + \zeta} \right) \geq 0$ for $\zeta \in \partial \mathbb{D} \setminus \{\pm 1\}$, it follows that the operator $M(\zeta)$ is bounded in $L^2(\Omega)$ and in $H^1(\Omega)$, uniformly for $\zeta \in \partial \mathbb{D} \setminus \{\pm 1\}$; see Lemma 3.1. By Parseval’s identity, the boundedness of $M(\zeta)$ implies that the operator $\mathcal{F}^{-1} M(\zeta) \mathcal{F}$ is bounded on both $\ell^2(L^2(\Omega))$ and $\ell^2(H^1(\Omega))$, i.e.,

$$\tau \sum_{n=1}^{\infty} \| \Delta v_n^{-\frac{1}{2}} \|_{L^2}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{L^2}^2 \quad \text{and} \quad \tau \sum_{n=1}^{\infty} \| \Delta v_n^{-\frac{1}{2}} \|_{H^1}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{H^1}^2.$$ 

Since $\| v_n^{-1/2} \|_{H^{s+2}} \leq C \| \Delta v_n^{-1/2} \|_{H^s}$ for $s = 0, 1$ (cf. [13, Theorem 5 of Chapter 6]), these two inequalities imply

$$\tau \sum_{n=1}^{\infty} \| v_n^{-1/2} \|_{H^2}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{H^2}^2 \quad \text{and} \quad \tau \sum_{n=1}^{\infty} \| v_n^{-1/2} \|_{H^3}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{H^1}^2.$$ 

This proves the estimate for the second term of (3.6).

Testing (3.5) by $-\Delta v_n^{-\frac{1}{2}}$ immediately yields

$$\frac{\| \nabla v_n \|_{L^2}^2 - \| \nabla v_n^{-1} \|_{L^2}^2}{2\tau} + \| \Delta v_n^{-\frac{1}{2}} \|_{L^2}^2 = (f^n, \Delta v_n^{-\frac{1}{2}}) \leq \| f^n \|_{L^2} \| \Delta v_n^{-\frac{1}{2}} \|_{L^2} \leq \frac{1}{2} \| f^n \|_{L^2}^2 + \frac{1}{2} \| \Delta v_n^{-\frac{1}{2}} \|_{L^2}^2,$$

which implies

(3.9)

$$\max_{1 \leq n \leq m} \| v_n \|_{H^1}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{L^2}^2.$$ 

This proves the estimate for the first term of (3.6) in the case $s = 0$.

If $f^n \in H^1_0(\Omega)$, then $\Delta v_n^{-\frac{1}{2}} \in H^1_0(\Omega)$, and testing (3.5) by $\Delta^2 v_n^{-\frac{1}{2}}$ yields

$$\frac{\| \Delta v_n \|_{L^2}^2 - \| \Delta v_n^{-1} \|_{L^2}^2}{2\tau} + \| \nabla \Delta v_n^{-\frac{1}{2}} \|_{L^2}^2 = (\nabla f^n, \nabla \Delta v_n^{-\frac{1}{2}}) \leq \| f^n \|_{H^1} \| \nabla \Delta v_n^{-\frac{1}{2}} \|_{L^2}^2.$$
Let \( f \) be the solution \((\mathbf{H}, \mathbf{u})(\mathbf{t})\) for \( \mathbf{u}(\mathbf{t}) \) and \( \mathbf{H}(\mathbf{t}) \) by \( \mathbf{H}(\mathbf{t}) \). Furthermore, we denote

\[
\max_{1 \leq n \leq m} \| \Delta \mathbf{u}^n \|_{L^2}^2 \leq C \tau \sum_{n=1}^{m} \| \mathbf{f}^n \|_{L^1}^2;
\]

therefore,

\[
\max_{1 \leq n \leq m} \| \mathbf{u}^n \|_{L^2}^2 \leq C \tau \sum_{n=1}^{m} \| \mathbf{f}^n \|_{L^1}^2.
\]

If \( f \in H^1(\Omega) \), then we choose \( f^n = e^{-1} \Delta f^n \). Similarly as (3.3), \( f^n \) has the following properties:

\[
f^n_j \in H^1_0(\Omega), \quad f^n_j \to f^n \quad \text{in} \quad L^2(\Omega) \quad \text{and} \quad \| f^n_j \|_{H^1} \leq C \| f^n \|_{H^1} \quad \text{as} \quad j \to \infty.
\]

Then, the corresponding \( \mathbf{v}^n_j \) satisfies

\[
\max_{1 \leq n \leq m} \| \mathbf{v}^n_j \|_{L^2}^2 \leq C \tau \sum_{n=1}^{m} \| f^n_j \|_{L^1}^2 \leq C \tau \sum_{n=1}^{m} \| f^n \|_{H^1}^2.
\]

Since \( f^n_j \to f^n \) in \( L^2(\Omega) \) as \( j \to \infty \), (3.9) implies that \( \mathbf{v}^n_j \to \mathbf{v}^n \) in \( H^1(\Omega) \). This together with (3.11) imply that \( \mathbf{v}^n_j \) is bounded and convergent to \( \mathbf{v}^n \) weakly in \( H^2(\Omega) \). Letting \( j \to \infty \), we obtain (3.10) for \( f^n \in H^1(\Omega) \). This proves the estimate for the first term of (3.6) in the case \( s = 1 \).

### 3.2. Consistency of the method.

We abbreviate \( \mathbf{u}(\cdot, \mathbf{t}) \) by \( \mathbf{u}(\mathbf{t}) \) and \( \mathbf{H}(\cdot, \mathbf{t}) \) by \( \mathbf{H}(\mathbf{t}) \). Furthermore, we denote

\[
\mathbf{H}_n = \mathbf{H}(t_n), \quad \mathbf{H}^n = \frac{1}{2} (\mathbf{H}^n + \mathbf{H}^{n-1}),
\]

\[
\mathbf{u}_n = \mathbf{u}(t_n), \quad \mathbf{u}^{n-\frac{1}{2}} = \frac{1}{2} (\mathbf{u}_n + \mathbf{u}^{n-1}),
\]

and \( t_{n-\frac{1}{2}} := (t_n + t_{n-1})/2 \).

Let \( \eta^n_H \) and \( \eta^n_u \) be the consistency errors of the modified Crank–Nicolson method (2.6), defined by

\[
\begin{aligned}
\partial_t \mathbf{H}^n + \nabla \cdot (\mathbf{H}^{n-\frac{1}{2}} \mathbf{u}^{n-\frac{1}{2}}) &= \eta^n_H, \\
\partial_t \mathbf{u}^n + \nabla \left( \frac{1}{4} (|\mathbf{u}_n|^2 + |\mathbf{u}_n|^2) + g(\mathbf{H}^{n-\frac{1}{2}} - \mathbf{b}) \right) \
+ (\nabla \times \mathbf{u}_n^{n-\frac{1}{2}} + f^{n-\frac{1}{2}}) \mathbf{k} \times \mathbf{u}_n^{n-\frac{1}{2}} - \mathbf{G}(\mathbf{H}^{n-\frac{1}{2}} - \mathbf{b}, \mathbf{u}_n^{n-\frac{1}{2}}) &= \eta^n_u, \quad n = 1, \ldots, N.
\end{aligned}
\]

It is straightforward to show that

\[
\max_{1 \leq n \leq N} (\| \eta^n_H \|_{H^2}^2 + \| \eta^n_u \|_{H^2}^2) \leq C \tau^2,
\]

provided that the solution \( (\mathbf{H}, \mathbf{u}) \) is sufficiently smooth.

### 3.3. Existence of discrete solutions.

Let \( \mathbf{e}_u^n := \mathbf{u}_n^n - \mathbf{u}^n \) and \( \mathbf{e}_H^n := \mathbf{H}_n^n - \mathbf{H}^n \) denote the errors of the modified Crank–Nicolson method (2.6). Subtracting (2.6) from the consistency equations
(3.14), we obtain the error equations

$$
\begin{aligned}
&\left\{ \begin{align*}
\partial_t e_H^n + \nabla \cdot (e_H^{n-\frac{1}{2}} u^{n-\frac{1}{2}} + H_*^{n-\frac{1}{2}} e_u^{n-\frac{1}{2}}) = \eta_H^{n}, \\
\partial_t e_u^n - \mu \frac{H^{-\frac{1}{2}}}{H^{n-\frac{1}{2}}} \nabla \cdot (H^{n-\frac{1}{2}} \nabla e_u^{n-\frac{1}{2}}) \\
&- \frac{\mu}{H^{n-\frac{1}{2}}} \nabla \cdot (e_H^{n-\frac{1}{2}} \nabla u^{n-\frac{1}{2}}) + \frac{\mu}{H^{n-\frac{1}{2}}} H_*^{n-\frac{1}{2}} e_H \cdot (H_*^{n-\frac{1}{2}} \nabla u_*^{n-\frac{1}{2}}) \\
&+ c_f \left( \frac{|u_*^{n-\frac{1}{2}}| |e_u^{n-\frac{1}{2}}|}{H_*^{n-\frac{1}{2}}} - \frac{|u^{n-\frac{1}{2}}| |u^{n-\frac{1}{2}}|}{H^{n-\frac{1}{2}}} \right) \\
&+ \frac{\mu}{4} (|u_*^{n-\frac{1}{2}} - |u^{n-\frac{1}{2}}| + |u_*^{n-1} - |u^{n-1}| + g \nabla e_H^{n-\frac{1}{2}}) \\
&+ (\nabla \times e_u^{n-\frac{1}{2}}) \hat{k} \cdot u_*^{n-\frac{1}{2}} - (\nabla \times v^{n-\frac{1}{2}}) \hat{k} \cdot u^{n-\frac{1}{2}} + f^{n-\frac{1}{2}} \hat{k} \cdot e_u^{n-\frac{1}{2}} = \eta_u^{n}.
\end{align*}
\right.
\end{aligned}
$$

(3.16)

**Remark 3.3.** Obviously, if \((e_H^n, e_u^n) \in H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2\) is a solution of (3.16) with \(H^n = H_*^n - e_H^n\) and \(u^n = u_*^n - e_u^n\), then \((H^n, u^n)\) is a solution of (2.6).

To prove existence of a solution \((e_H^n, e_u^n)\) to (3.16) with \(H^n = H_*^n - e_H^n\) and \(u^n = u_*^n - e_u^n\), we first prove existence of a solution for a regularized approximating problem (for which the proof of existence is easier, as explained in Remark 3.4). To this end, we let \(E : L^1(\Omega) \to L^1(\mathbb{R}^2)\) be a linear extension operator that is bounded also from \(W^k,p(\Omega)\) to \(W^k,p(\mathbb{R}^2)\) for all \(k \geq 0\) and \(1 \leq p \leq \infty\). Such an extension operator indeed exists; see [23, p. 181, Theorem 5]. Then, we let \(\sigma_{\varepsilon}\) be a standard smooth mollifier in \(\mathbb{R}^2\) and define

\[\sigma_{\varepsilon} \ast \varphi^{n-\frac{1}{2}} := \sigma_{\varepsilon} \ast E \varphi^{n-\frac{1}{2}}.\]

The mollified function \(\sigma_{\varepsilon} \ast \varphi^{n-\frac{1}{2}}\) is smooth and satisfies

$$\|\sigma_{\varepsilon} \ast \varphi^{n-\frac{1}{2}}\|_{H^m(\mathbb{R}^2)} \leq C_0 (m-k) \|\varphi^{n-\frac{1}{2}}\|_{H^m(\Omega)}, \quad \forall \varphi^{n-\frac{1}{2}} \in W^k,p(\Omega), \quad 0 \leq k \leq m.\tag{3.17}$$

We consider the following regularized problem an approximation to (3.16):

$$
\begin{aligned}
&\left\{ \begin{align*}
\partial_t e_H^n + \nabla \cdot (e_H^{n-\frac{1}{2}} u^{n-\frac{1}{2}} + H_*^{n-\frac{1}{2}} e_u^{n-\frac{1}{2}}) = \eta_H^{n}, \\
\partial_t e_u^n - \frac{\mu}{H^{n-\frac{1}{2}}} \nabla \cdot (H^{n-\frac{1}{2}} \nabla e_u^{n-\frac{1}{2}}) \\
&- \frac{\mu}{H^{n-\frac{1}{2}}} \nabla \cdot (\sigma_{\varepsilon} e_H^{n-\frac{1}{2}} \nabla u^{n-\frac{1}{2}}) + \frac{\mu}{H^{n-\frac{1}{2}}} H_*^{n-\frac{1}{2}} \sigma_{\varepsilon} e_H^{n-\frac{1}{2}} \nabla \cdot (H_*^{n-\frac{1}{2}} \nabla u_*^{n-\frac{1}{2}}) \\
&+ c_f \left( \frac{|u_*^{n-\frac{1}{2}}| |e_u^{n-\frac{1}{2}}|}{H_*^{n-\frac{1}{2}}} - \frac{|u^{n-\frac{1}{2}}| |u^{n-\frac{1}{2}}|}{H^{n-\frac{1}{2}}} \right) \\
&+ \frac{\mu}{4} (|u_*^{n-\frac{1}{2}} - |u^{n-\frac{1}{2}}| + |u_*^{n-1} - |u^{n-1}| + g \nabla (\sigma_{\varepsilon} e_H^{n-\frac{1}{2}}) \\
&+ \nabla \times (u_*^{n-\frac{1}{2}} - u^{n-\frac{1}{2}}) \hat{k} \times u^{n-\frac{1}{2}} - (\nabla \times u^{n-\frac{1}{2}}) \hat{k} \times (u_*^{n-\frac{1}{2}} - u^{n-\frac{1}{2}}) \\
&+ f^{n-\frac{1}{2}} \hat{k} \times e_u^{n-\frac{1}{2}} = \eta_u^{n},
\end{align*}
\right.
\end{aligned}
$$

(3.18)

with

$$\begin{aligned}
H_*^{n} &= H_*^{n} - \sigma_{\varepsilon} e_H^{n} \quad \text{and} \quad u^n = u_*^n - e_u^n.
\end{aligned}
$$

(3.19)
Remark 3.4. If (3.18) has a solution \((\varepsilon_n^H, \varepsilon_n^u)\) bounded in \(H^2(\Omega) \times [H^3(\Omega) \cap H_0^1(\Omega)]^2\) uniformly for \(1 \leq n \leq N\) and \(\varepsilon \in (0, 1)\), then there exists a sequence \(\varepsilon_k \to 0\) such that the corresponding sequence of solutions of (3.18) converges strongly in \(H^1(\Omega) \times [H^2(\Omega) \cap H_0^1(\Omega)]^2\) and weakly in \(H^2(\Omega) \times [H^3(\Omega) \cap H_0^1(\Omega)]^2\) to a solution of (3.16). The rigorous proof of this “pass to limit” is routine.

To prove existence of solutions for the regularized problem (3.18), we use Schaefer’s fixed point theorem (cf. [13, Chapter 9.2, Theorem 4]).

Schaefer’s Fixed Point Theorem: Let \(Y\) be a Banach space and let \(M: Y \to Y\) be a continuous and compact map (possibly nonlinear). If the set
\[
\{ \phi \in Y : \phi = \theta M(\phi) \text{ for some } \theta \in [0, 1] \}
\]
is bounded in \(Y\), then the map \(M\) has a fixed point.

Construction of the map \(M\): Let \(X = H^1(\Omega) \times (H^3(\Omega) \cap H_0^1(\Omega))^2\) and consider the space \((X^N, \| \cdot \|_{\infty(X)}\) of sequences \((\phi^n, \varphi^n)_{n=1}^N\), with \((\phi^n, \varphi^n) \in X\), endowed with the following norm:
\[
\| (\phi^n, \varphi^n) \|_{\infty(X)} := \max_{1 \leq n \leq N} \| (\phi^n, \varphi^n) \|_X.
\]
For any sequence \((\phi^n, \varphi^n)_{n=1}^N \in X^N\) we define
\[
\rho_{\phi, \varepsilon}^H := \min \left( \frac{H_{\min}}{2} \max_{1 \leq n \leq N} \left( \| \sigma \ast \phi^n \|_{H^2} + \| \sigma \ast \phi^n \|_{L^\infty} \right), 1 \right),
\]
\[
\rho_{\varphi}^u := \min \left( \max_{1 \leq n \leq N} \left( \| \phi^n \|_{H^3} + \| \nabla \cdot \varphi^n \|_{L^\infty} \right), 1 \right),
\]
\[
H_{\phi, \varepsilon}^n = H_*^n - \rho_{\phi, \varepsilon}^H \sigma \ast \phi^n \quad \text{and} \quad u_{\varphi}^n = u_*^n - \rho_{\varphi}^u \varphi^n.
\]
Then \(\rho_{\phi, \varepsilon}^H \sigma \ast \phi^n \|_{H^2} \leq \frac{H_{\min}}{2} \) and therefore
\[
H_{\phi, \varepsilon}^n \geq \frac{H_{\min}}{2}.
\]
For any fixed \(\varepsilon > 0\), the quantities \(\rho_{\phi, \varepsilon}^H\) and \(\rho_{\varphi}^u\) depend continuously on \((\phi^n, \varphi^n)_{n=1}^N \in X^N\), and
\[
\| \rho_{\phi, \varepsilon}^H \sigma \ast \phi^n \|_{H^2} \leq \frac{H_{\min}}{2} \quad \text{and} \quad \| \rho_{\varphi}^u \varphi^n \|_{H^3} \leq 1,
\]
\[
\| H_{\phi, \varepsilon}^n \|_{H^2} \leq \frac{H^n}{2} + \frac{H_{\min}}{2} \quad \text{and} \quad \| u_{\varphi}^n \|_{H^3} + \| \nabla \cdot u_{\varphi}^n \|_{L^\infty} \leq \| u_*^n \|_{H^3} + \| \nabla \cdot u_*^n \|_{L^\infty} + 1.
\]

For any given \((\phi^n, \varphi^n)_{n=1}^N \in X^N\), we define \((e^n_H, e^n_u)_{n=1}^N \in X^N\) to be the solution of the following linear problem:
\[
\partial_t e^n_H + \nabla \cdot \left( e^n_H - \frac{\mu}{H_{\phi, \varepsilon}^n} \right) \nabla \cdot \left( H_{\phi, \varepsilon} e^n_H \nabla e^n_H \right) = \eta^n_H,
\]
\[
\partial_t e^n_u - \frac{\mu}{H_{\phi, \varepsilon}^n} \nabla \cdot \left( H_{\phi, \varepsilon} e^n_H \nabla e^n_H \right).
\]
\[
- \frac{\mu}{H_{\phi, \varepsilon}^n} \nabla \cdot \left( \sigma \ast \phi^n \ast \frac{\sigma \ast \phi^n}{2} \nabla u_{\varphi}^n \right) + \frac{\mu}{H_{\phi, \varepsilon}^n} \sigma \ast \phi^n \ast \frac{\sigma \ast \phi^n}{2} \nabla \cdot \left( H_{\phi, \varepsilon} \nabla u_{\varphi}^n \right)
\]
\[
+ c_f \left( \frac{|u_*^n| u_{\varphi}^n |u_*^n| - |u_{\varphi}^n| u_{\varphi}^n |u_*^n|}{H_{\phi, \varepsilon}^n} \right)
\]
Let \( e^{n-1}_H \in H^2(\Omega) \), then (3.26)–(3.27) has a unique solution \((e^n_H, e^n_u)\) satisfying the following estimate:

\[
\left\| e^{n-1}_H \right\|_{H^2} \leq C \left\| g^n_H \right\|_{H^2},
\]

This implies that (3.26) has a unique solution \( e^n_H \in H^2(\Omega) \), given \( \varepsilon \), and given \((\phi^n, \varphi^n)_{n=1}^N \in X^N\), the system (3.26)–(3.27) has a unique solution \((e^n_H, e^n_u)\) in \(H^2(\Omega) \cap H^1_0(\Omega))\) for \( n = 1, \ldots, N \). Moreover, the map \( M : X^N \to X^N \) is well defined, continuous, and compact.

**Proof.** For given \( e^{n-1}_H \in H^2(\Omega) \), (3.26) can be written as

\[
\frac{2}{\tau} e^{n-1}_H + n^{1/2} \nabla e^{n-1}_H + (\nabla \cdot u^{n-1}) e^{n-1}_H = g^n_H
\]

with

\[
g^n_H = \eta^n_H - \nabla \cdot (H^{n-1}_* \varphi^{n-1}) + \frac{2}{\tau} e^{n-1}_H \in H^2(\Omega).
\]

The linear hyperbolic equation (3.29) has a unique solution \( e^{n-1}_H \in H^2(\Omega) \) and satisfies the following estimate (see Appendix):

\[
\left\| e^{n-1}_H \right\|_{H^2} \leq C \left\| g^n_H \right\|_{H^2}.
\]

This implies that (3.26) has a unique solution \( e^n_H \in H^2(\Omega) \), \( n = 1, \ldots, N \).

Similarly, for given \( e^{n-1}_u \in H^2(\Omega) \cap H^1_0(\Omega) \), (3.27) can be written as a linear elliptic equation

\[
\frac{2}{\tau} e^{n-1}_u - \frac{\mu}{H_{\phi,e}^{n-1/2}} \nabla \cdot (H^{n-1/2}_{\phi,e} \nabla e^{n-1}_u) = -g^n_u
\]

with \( g^n_u \in H^2(\Omega) \) given by

\[
g^n_u = -\frac{\mu}{H_{\phi,e}^{n-1/2}} \nabla \cdot (\sigma_{\varepsilon} \phi^{n-1} \nabla u^{n-1}_\sigma) + \frac{\mu}{H_{\phi,e}^{n-1/2}} \sigma_{\varepsilon} \phi^{n-1/2} \nabla \cdot (H^{n-1/2}_\phi \nabla u^{n-1}_\phi) + c_f \left( \frac{|u^n|}{H^{n-1/2}_\phi} \frac{|u^{n-1}|}{H^{n-1/2}_\phi} \right) + \frac{1}{4} \nabla (u^n + u^{n-1}) \phi^n + (u^{n-1} + u^n) \phi^{n-1}) + g\nabla (\sigma_{\varepsilon} \phi^{n-1/2})
\]

\[
+ (\nabla \times \varphi^{n-1/2}) k \times u^{n-1/2} + (\nabla \times u^{n-1/2}) k \times \varphi^{n-1/2} + f^{n-1/2} k \times \varphi^{n-1/2} - \eta^n_u + \frac{2}{\tau} e^{n-1}_u.
\]

It is well known that the elliptic equation (3.30) has a unique solution \( e^{n-1}_u \in [H^1(\Omega) \cap H^1_0(\Omega)]^2 \), satisfying the following estimate:

\[
\left\| e^{n-1}_u \right\|_{H^1} \leq C \left\| g^n_u \right\|_{H^2}.
\]

Therefore, the map \( M : X^N \to X^N \) is well defined. Furthermore, if \((\phi^n, \varphi^n)_{n=1}^N \) is bounded in \( X^N \), then \((e^n_H, e^n_u)_{n=1}^N \) is bounded in \((H^2(\Omega) \times [H^1(\Omega) \cap H^1_0(\Omega)]^2)^N \), which is compactly embedded into \( X^N \). Thus the map \( M : X^N \to X^N \) is compact.

The continuity of the map can be proved in the standard way, and the proof is omitted.\[\blacksquare\]
Remark 3.6. For any fixed \( \varepsilon > 0 \), the mollified functions \( H^{n-\frac{1}{2}}_{\varepsilon} \) and \( \sigma_{\varepsilon} \ast \phi^{n-\frac{1}{2}} \) are sufficiently smooth. As a result, the solution of (3.27) is in \([H^4(\Omega) \cap H^1_0(\Omega)]^2\), compactly embedded into \([H^3(\Omega) \cap H^1_0(\Omega)]^2\). Hence, the regularization using mollifiers guarantees that the map \( M : X^N \to X^N \) is compact. Without the regularization, the map \( M : X^N \to X^N \) is well defined and continuous, but it is difficult to prove its compactness.

In Lemma 3.5, we proved that the first condition of Schaefer’s Fixed Point Theorem is satisfied, i.e., that the proposed map \( M : X^N \to X^N \) is well defined, continuous and compact. In the following lemma, we will prove that the second condition of Schaefer’s Fixed Point Theorem is also satisfied, i.e., the set defined in (3.20) is bounded in \( Y = X^N \).

Lemma 3.7. There exists a positive constant \( \tau_0 \) such that the following result holds for \( \tau \leq \tau_0 \): if \( (\phi^n, \varphi^n)_{n=1}^N \) satisfies
\[
(\phi^n, \varphi^n)_{n=1}^N = \theta M[(\phi^n, \varphi^n)_{n=1}^N] \quad \text{for some } \theta \in [0, 1],
\]
then \( (\phi^n, \varphi^n)_{n=1}^N \) is bounded in \( (H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2)^N \to X^N \) uniformly for \( \theta \in [0, 1] \) and \( \varepsilon \in (0, 1) \). More precisely, \( \rho\|_\theta^H = \rho\|_\phi = 1 \) and
\[
\max_{1 \leq n \leq N} (\|\phi^n\|_{H^2} + \|\phi^n\|_{L^\infty}) \leq \frac{H_{\min}}{2} \quad \text{and} \quad \max_{1 \leq n \leq N} \|\varphi^n\|_{H^1} \leq 1.
\]

The proof of Lemma 3.7 is presented in the next two subsections together with error estimates for the discrete solutions.

Lemma 3.7 and Schaefer’s fixed point theorem imply that the map \( M \) has at least one fixed point, which we denote by \( (e_H^n, e_u^n)_{n=1}^N \). In the case \( \rho\|_\phi = \rho\|_\varphi = 1 \), the fixed point \( (e_H^n, e_u^n)_{n=1}^N \) of \( M \) satisfies
\[
H^n - \sigma_{\varepsilon} \ast e_H^n = e_H^n \quad \text{and} \quad u^n = u^n - e_u^n = u^n,
\]
where \( H^n \) and \( u^n \) are defined in (3.19). Therefore, (3.26)–(3.27) reduces to (3.18). Hence, Lemma 3.7 implies existence of a solution to the regularized problem (3.18).

Lemma 3.7 implies that the fixed point \( (e_H^n, e_u^n) \) is bounded in \( (H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2)^N \) uniformly for \( \varepsilon \in (0, 1) \). This implies that there exists a subsequence \( \varepsilon_k \to 0 \) such that the corresponding solutions of the regularized problem converge to a solution of (3.16) with
\[
H^n = H^n - e_H^n \quad \text{and} \quad u^n = u^n - e_u^n.
\]
This proves existence of a solution for the proposed method (2.6), as explained in Remark 3.3, while (3.32) implies that the solution is in \( B_{H_\varepsilon}^n \), which is defined in (2.10).

Proof of Lemma 3.7. If \( (\phi^n, \varphi^n)_{n=1}^N \in X^N \) satisfies (3.31), then \( (e_H^n, e_u^n)_{n=1}^N = M[(\phi^n, \varphi^n)_{n=1}^N] \) is the solution of (3.26)–(3.27) and
\[
(\phi^n = \theta e_H^n \quad \text{and} \quad \varphi^n = \theta e_u^n).
\]
In view of this, we assume that \( (\phi^n, \varphi^n)_{n=1}^N \) is the solution of (3.26)–(3.27) for some \( \varepsilon \in [0, 1] \) with \( (\phi^n, \varphi^n) \) given by (3.33). Then, we estimate \( e_H^n \) and \( e_u^n \) separately in the next two subsections.

Remark 3.8. Although the proof of Lemma 3.7 only needs the case \( \varepsilon \in (0, 1) \), the estimates obtained in the next two subsections include the case \( \varepsilon = 0 \) (assuming that there exists a solution in this case).

3.4. Estimation of \( e_H^n \). We rewrite (3.26) as
\[
\partial_t e_H^n + u^n \cdot \nabla e_H^n = \eta^n_H + I^n_1 + I^n_2 + I^n_3,
\]
with
\[
I^n_1 = -\varepsilon_H^{n-\frac{1}{2}} \nabla \cdot u^{n-\frac{1}{2}}, \quad I^n_2 = -\theta u^{n-\frac{1}{2}} \cdot \nabla H^{n-\frac{1}{2}}, \quad I^n_3 = -\theta H^{n-\frac{1}{2}} \cdot \nabla u^{n-\frac{1}{2}}.
\]

Let \( \partial_i \) be the partial differentiation operator with respect to \( x_i \) and let \( \partial \partial_j = \partial_i \partial_j, i, j = 1, 2 \).

Application of the differential operator \( \partial \partial_j \) to (3.34) yields
\[
\partial \partial_i \partial \partial_j e^n_H + u^{n-\frac{1}{2}} \cdot \nabla \partial \partial_j e^n_H = \partial \partial_j \eta^n_H + \partial \partial_j I^n_1 + \partial \partial_j I^n_2 + \partial \partial_j I^n_3 + I^n_4,
\]
with
\[
I^n_4 = -\partial_i u^{n-\frac{1}{2}} \cdot \nabla \partial \partial_j e^n_H - \partial \partial_j u^{n-\frac{1}{2}} \cdot \nabla \partial \partial_i e^n_H - \partial \partial_j u^{n-\frac{1}{2}} \cdot \nabla e^n_H.
\]

Then, testing (3.36) by \( 2 \partial \partial_j e^{n-\frac{1}{2}}_H \), we obtain
\[
\partial \partial_i \| \partial \partial_j e^n_H \|^2 = (\nabla \cdot u^{n-\frac{1}{2}}, 2|\partial \partial_j e^{n-\frac{1}{2}}_H|^2) + (\partial \partial_j \eta^n_H, 2\partial \partial_j e^{n-\frac{1}{2}}_H)
\]
\[
+ \sum_{\ell=1}^3 (\partial \partial_j I^n_\ell, 2\partial \partial_j e^{n-\frac{1}{2}}_H) + (I^n_4, 2\partial \partial_j e^{n-\frac{1}{2}}_H).
\]

By using the expressions in (3.35) and (3.37), we have
\[
|\partial \partial_j I^n_1, 2\partial \partial_j e^{n-\frac{1}{2}}_H| \leq \| \partial \partial_j e^{n-\frac{1}{2}}_H \| \| e^{n-\frac{1}{2}}_H \| h^2,
\]
\[
|\partial \partial_j I^n_2, 2\partial \partial_j e^{n-\frac{1}{2}}_H| \leq \| \partial \partial_j \eta^n_H \| \| e^{n-\frac{1}{2}}_H \| h^2,
\]
\[
|\partial \partial_j I^n_3, 2\partial \partial_j e^{n-\frac{1}{2}}_H| \leq \| H^n_\ast \| \| e^{n-\frac{1}{2}}_H \| h^2,
\]
\[
|I^n_4, 2\partial \partial_j e^{n-\frac{1}{2}}_H| \leq \| \partial \partial_j e^{n-\frac{1}{2}}_H \| \| e^{n-\frac{1}{2}}_H \| h^2.
\]

Substituting these estimates into (3.38) and using estimate (3.25), we obtain
\[
\partial \partial_i \| \partial \partial_j e^n_H \|^2 \leq C e^{n-\frac{1}{2}}_H \| e^{n-\frac{1}{2}}_H \| h^2 + C \| e^{n-\frac{1}{2}}_H \| h^3 + C \| \partial \partial_j \eta^n_H \| h^2, \quad i, j = 1, 2.
\]

Similar estimates can also be obtained for \( \partial \partial_j e^n_H \) and \( e^n_H \),
\[
\partial \partial_i \| \partial \partial_j e^n_H \|^2 \leq C e^{n-\frac{1}{2}}_H \| e^{n-\frac{1}{2}}_H \| h^1 + C \| e^{n-\frac{1}{2}}_H \| h^3 + C \| \partial \partial_j \eta^n_H \| h^2, \quad j = 1, 2.
\]
and
\[ \tilde{\partial}_t \| e_H^n \|^2 \leq C \| e_H^{n-\frac{1}{2}} \|^2 + C \| e_u^{n-\frac{1}{2}} \|^2 H^2 + C \| \eta_H^n \|^2. \]

Summing up these estimates yields
\[ \tilde{\partial}_t \| e_H^n \|^2 H^2 \leq C \| e_H^{n-\frac{1}{2}} \|^2 H^2 + C \| e_u^{n-\frac{1}{2}} \|^2 H^3 + C \| \eta_H^n \|^2 H^2. \]

### 3.5. Estimation of $e_u^n$

We rewrite (3.27) as
\[ \tilde{\partial}_t e_u^n - \mu \Delta e_u^{n-\frac{1}{2}} = \eta_u^n + \sum_{i=1}^{8} J_i^n, \]
with
\begin{align*}
J_1^n &= \frac{\mu}{\phi^u} \nabla H_{\phi^u}^{n-\frac{1}{2}} \cdot \nabla e_u^{n-\frac{1}{2}}, \\
J_2^n &= \frac{\theta \mu}{\phi^u} \nabla \cdot (\sigma_e^u \cdot e_H^{n-\frac{1}{2}} \nabla u_\alpha^{n-\frac{1}{2}}), \\
J_3^n &= \frac{\theta}{\phi^u} (\theta_{\phi^u} e_H^{n-\frac{1}{2}} \nabla \cdot (H_{\phi^u}^{n-\frac{1}{2}} \nabla u_\alpha^{n-\frac{1}{2}}), \\
J_4^n &= -c_f (\frac{|u_{\alpha}^{n-\frac{1}{2}}| u_{\alpha}^{n-\frac{1}{2}} | u_{\alpha}^{n-\frac{1}{2}} | u_{\alpha}^{n-\frac{1}{2}} - |u_{\alpha}^{n-\frac{1}{2}}| u_{\alpha}^{n-\frac{1}{2}} | u_{\alpha}^{n-\frac{1}{2}} | u_{\alpha}^{n-\frac{1}{2}})^{H_{\phi^u}^{n-\frac{1}{2}}}, \\
J_5^n &= -\frac{\theta}{4} \nabla ((u_\alpha^n + u_{\alpha}^{n-1}) e_u^n + (u_\alpha^{n-1} + u_{\alpha}^{n-1}) e_u^{n-1}), \\
J_6^n &= -\theta g \nabla (\sigma_e^u \cdot e_H^{n-\frac{1}{2}}), \\
J_7^n &= -\theta (\nabla \times e_u^{n-\frac{1}{2}}) \hat{k} \times u_\alpha^{n-\frac{1}{2}} - \theta (\nabla \times u_\alpha^{n-\frac{1}{2}}) \hat{k} \times e_u^{n-\frac{1}{2}}, \\
J_8^n &= -\theta f^{n-\frac{1}{2}} \hat{k} \times e_u^{n-\frac{1}{2}},
\end{align*}

where we have substituted $\phi^n = \theta e_H^n$ and $\varphi^n = \theta e_{\alpha}^n$ into the expressions above. Notice that
\[ \sum_{n=1}^{m} \| \tilde{\partial}_t e_u^n \|^2_{H^1} = \sum_{n=1}^{m} \| \mu \Delta e_u^{n-\frac{1}{2}} + \eta_u^n + \sum_{i=1}^{7} J_i^n \|^2_{H^1} \leq C \sum_{n=1}^{m} (\| e_u^{n-\frac{1}{2}} \|^2_{H^3} + \| \eta_u^n + \sum_{i=1}^{7} J_i^n \|^2_{H^3}). \]

Therefore, applying Lemma 3.2 with $s = 1$ to equation (3.40), we obtain
\[ \max_{1 \leq n \leq m} \| e_u^n \|^2_{H^2} + \tau \sum_{n=1}^{m} \left( \| \tilde{\partial}_t e_u^n \|^2_{H^1} + \| e_u^{n-\frac{1}{2}} \|^2_{H^3} \right) \leq C \tau \sum_{n=1}^{m} \left( \| \eta_u^n \|^2_{H^1} + \| J_i^n \|^2_{H^3} \right). \]

By using estimate (3.25), it is straightforward to verify that
\[ \| J_i^n \|^2_{H^1} \leq C (\| H_{\phi^u}^{n-\frac{1}{2}} \|_{H^2} \| \nabla e_u^{n-\frac{1}{2}} \|_{L^\infty} + \| H_{\phi^u}^{n-\frac{1}{2}} \|_{W^{1,4}} \| e_u^{n-\frac{1}{2}} \|_{W^{2,4}}). \]
where $\delta \in (0, 1)$ can be arbitrarily small at the expense of enlarging the constant $C_\delta$.

Similarly, we have
\[
\| J^a_1 \|_{H^1} \leq C \| e_u^{n-\frac{1}{2}} \|_{H^2},
\]
\[
\| J^a_3 \|_{H^1} \leq C \| e_H^{n-\frac{1}{2}} \|_{H^1},
\]
\[
\| J^a_5 \|_{H^1} \leq C \| e_u^{n-\frac{1}{2}} \|_{H^2},
\]
\[
\| J^a_6 \|_{H^1} \leq C \| e_H^{n-\frac{1}{2}} \|_{H^2},
\]
\[
\| J^a_7 \|_{H^1} \leq C \| e_u^{n-\frac{1}{2}} \|_{H^1}.
\]

By the integral form of the mean value theorem,
\[
|u_s^{n-\frac{1}{2}}|u_s^{n-\frac{1}{2}} - |u_s^{n-\frac{1}{2}}|u_\varphi^{n-\frac{1}{2}} = (u_s^{n-\frac{1}{2}} - u_\varphi^{n-\frac{1}{2}}) \cdot \int_0^1 2(1-s)u_s^{n-\frac{1}{2}} + su_\varphi^{n-\frac{1}{2}}|ds
\]
\[
= \rho_\varphi^{n-\frac{1}{2}} \int_0^1 2(1-s)u_s^{n-\frac{1}{2}} + su_\varphi^{n-\frac{1}{2}}|ds
\]
\[
= \rho_\varphi^{n-\frac{1}{2}} \int_0^1 2(1-s)u_s^{n-\frac{1}{2}} + su_\varphi^{n-\frac{1}{2}}|ds,
\]

which implies (together with $|\rho_\varphi^n| \leq 1$ and $\theta \leq 1$)
\[
\| J^a_1 \|_{H^1} \leq C(\| e_H^{n-\frac{1}{2}} \|_{H^1} + C \| e_u^{n-\frac{1}{2}} \|_{H^1}).
\]

Substituting the estimates of $\| J^a_i \|_{H^1}$, $i = 1, \ldots, 8$, into (3.41), we obtain
\[
\max_{1 \leq n \leq m} \| e_u^n \|^2_{H^2} + \sum_{n=1}^m (\| \partial_t e_u^n \|^2_{H^1} + \| e_u^{n-\frac{1}{2}} \|^2_{H^3})
\]
\[
\leq C_\delta \tau \sum_{n=1}^m (\| e^n_H \|^2_{H^2} + \| e^n_u \|^2_{H^2} + \| e^{n-1}_u \|^2_{H^2} + \| e^{n-\frac{1}{2}}_H \|^2_{H^3}) + \delta \tau \sum_{n=1}^m \| e_u^{n-\frac{1}{2}} \|^2_{H^3}.
\]

Adding $\delta \times (3.39)$ to (3.42), we have
\[
\max_{1 \leq n \leq m} (\| e^n_H \|^2_{H^2} + \| e^n_u \|^2_{H^2}) + \tau \sum_{n=1}^m (\| \partial_t e_u^n \|^2_{H^1} + \| e_u^{n-\frac{1}{2}} \|^2_{H^3})
\]
\[
\leq \delta \tau \sum_{n=1}^m \| e_u^{n-\frac{1}{2}} \|^2_{H^3} + C_\delta \tau \sum_{n=1}^m (\| e^n_H \|^2_{H^2} + \| e^n_u \|^2_{H^2} + \| e^{n-1}_u \|^2_{H^2} + \| e^{n-\frac{1}{2}}_H \|^2_{H^2}).
\]

Choosing here sufficiently small $\delta$, the first term on the right-hand side of the above inequality can
be absorbed by the left-hand side, and we infer that

$$
\max_{1 \leq n \leq m} \left( \| e_H^n \|_{H^2}^2 + \| e_u^n \|_{H^2}^2 + \tau \sum_{n=1}^m \left( \| \bar{\partial}_t e_u^n \|_{H^1}^2 + \| e_u^{n-\frac{1}{2}} \|_{H^3}^2 \right) \right)
$$

(3.43)

$$
\leq C \tau \sum_{n=1}^m \left( \| \eta_H^n \|_{H^2}^2 + \| \eta_u^n \|_{H^1}^2 + \| e_u^n \|_{H^2}^2 + \| e_u^{n-1} \|_{H^2}^2 + \| e_u^{n-\frac{1}{2}} \|_{H^3}^2 \right).
$$

Then, by using the discrete Gronwall inequality, for sufficiently small $\tau$ we obtain

$$
\max_{1 \leq n \leq N} \left( \| e_H^n \|_{H^2}^2 + \| e_u^n \|_{H^2}^2 \right) + \tau \sum_{n=1}^N \left( \| \bar{\partial}_t e_u^n \|_{H^1}^2 + \| e_u^{n-\frac{1}{2}} \|_{H^3}^2 \right)
$$

(3.44)

$$
\leq C \tau \sum_{n=1}^N \left( \| \eta_H^n \|_{H^2}^2 + \| \eta_u^n \|_{H^1}^2 \right).
$$

This and the consistency estimate (3.15) imply

$$
\max_{1 \leq n \leq N} \left( \| e_H^n \|_{H^2}^2 + \| e_u^n \|_{H^2}^2 \right) \leq C \tau^2
$$

(3.45)

$$
\tau \sum_{n=1}^N \| e_u^{n-\frac{1}{2}} \|_{H^3}^2 \leq C \tau^3.
$$

(3.46)

In all the estimates above, the generic constant $C$ is independent of $\varepsilon$.

Now, (3.46) implies \( \| e_u^n \|_{H^3} \leq \| e_u^{n-1} \|_{H^3} + C \tau^{3/2} \) and, therefore,

$$
\max_{1 \leq n \leq N} \| e_u^n \|_{H^3} \leq C \tau^{\frac{3}{2}}.
$$

(3.47)

In view of (3.45) and (3.47), there exists a positive constant $\tau_0$ such that, for $0 < \tau \leq \tau_0$, we have

$$
\max_{1 \leq n \leq N} \| e_H^n \|_{H^2} \leq \frac{H_{\min}}{2} \quad \text{and} \quad \max_{1 \leq n \leq N} \| e_u^n \|_{H^3} \leq 1.
$$

(3.48)

Thus,

$$
\max_{1 \leq n \leq N} \| \phi^n \|_{H^2} \leq \frac{H_{\min}}{2} \quad \text{and} \quad \max_{1 \leq n \leq N} \| \varphi^n \|_{H^3} \leq 1
$$

(3.49)

and we infer that indeed

$$
\rho^H_{\phi,\varepsilon} = \rho^u_{\varphi} = 1.
$$

(3.50)

In particular, (3.49) implies that \((\phi^n, \varphi^n)_{n=1}^N\) is bounded in \((H^2(\Omega) \times [H^3(\Omega) \cap H^1_0(\Omega)]^2)^N \hookrightarrow X^N\) uniformly for $\theta \in [0,1]$, $\varepsilon \in (0,1)$, and $0 < \tau \leq \tau_0$. This proves Lemma 3.7.

### 3.6. Error estimate.

The analysis following Lemma 3.7 proves existence of a solution to (2.6) in $B^n_{H,u}$.

If \((H^n, u^n) \in B^n_{H,u}\) is a solution of (2.6), then the error \((e_H^n, e_u^n)\) is a solution of (3.26)-(3.27) with \((\phi^n, \varphi^n)\) given by (3.33), with $\theta = 1$ and $\varepsilon = 0$. Then, the proof of Lemma 3.7 implies (3.45)-(3.46); see Remark 3.8 for the case $\varepsilon = 0$. This proves the error estimate (2.11).

### 3.7. Uniqueness of discrete solutions.

If there are two solutions of (2.6), say \((H^n, u^n) \in B^n_{H,u}\) and \((\tilde{H}^n, \tilde{u}^n) \in B^n_{H,u}\), then the error functions

$$
e_H = \tilde{H}^n - H^n \quad \text{and} \quad e_u = \tilde{u}^n - u^n
$$
satisfy (3.16) with $H^{n-\frac{1}{2}}$ and $u^{n-\frac{1}{2}}$ replaced by $\widetilde{H}^n$ and $\widetilde{u}^n$, respectively, and with $\eta_H^n = \eta_u^n = 0$.

Then, the error estimate (3.44) holds, which implies $e_H^n = e_u^n = 0$. This proves uniqueness of discrete solutions.

4. Numerical results. In this section, we present numerical results to support our theoretical analysis in Theorems 2.1 and 2.2.

We test energy decay and convergence rates of the proposed method by solving the initial and boundary value problem (1.1)–(1.4) in the domain $\Omega = [0, 1] \times [0, 1]$ with the following initial values:

$$H_0(x, y) = 1.0 + 0.2\sin(\pi x), \quad u_0(x, y) = (\sin^2(\pi x)y^2(1 - y)^2, x^2(1 - x)^2\sin^2(\pi y))^T,$$

and with $g = 10$ and $H_b = \mu = c_f = 1$.

We solve the problem by using the proposed time discretization method with the FEM in (2.9), with a sufficiently small mesh size $h$ such that the spatial discretization error is negligible in observing the temporal convergence rates. The nonlinear system (2.9) is solved by the following fixed-point iteration: choose $u_{n,0}^h = u_{n-1}^h$ and compute $(H_{h,\ell}^n, u_{h,\ell}^n), \ell = 1, 2, \ldots,$ by

$$
\begin{align*}
(\bar{\partial}_t H_{h,\ell}^n, \phi_h) &- (H_{h,\ell}^{n-\frac{1}{2}} u_{h,\ell}^{n-\frac{1}{2}}, \nabla \phi_h) = 0 \quad \forall \phi_h \in S_h, \\
(\bar{\partial}_t u_{h,\ell}^n, H_{h,\ell}^{n-\frac{1}{2}} v_h) &+ (\mu H_{h,\ell}^{n-\frac{1}{2}} \nabla u_{h,\ell}^{n-\frac{1}{2}}, \nabla v_h) + (c_f|u_{h,\ell}^{n-\frac{1}{2}}| u_{h,\ell}^{n-\frac{1}{2}}, v_h) \\
&= - (\nabla P_h \frac{1}{4} (|u_{h,\ell-1}^n|^2 + |u_{h}^{n-1}|^2) + g(H_{h,\ell}^{n-\frac{1}{2}} - H_b), H_{h,\ell}^{n-\frac{1}{2}} v_h) \\
&- ((\nabla \times u_{h,\ell}^{n-\frac{1}{2}} + f^{n-\frac{1}{2}}) k \times u_{h,\ell}^{n-\frac{1}{2}}, H_{h,\ell}^{n-\frac{1}{2}} v_h) \quad \forall v_h \in S_h^2.
\end{align*}
$$

For given $u_{h,\ell-1}^{n-\frac{1}{2}}$, one can determine $H_{h,\ell}^{n-\frac{1}{2}}$ from the first equation of (4.1) and then compute $H_{h,\ell}^{n-\frac{1}{2}}$. By using this computed $H_{h,\ell}^{n-\frac{1}{2}}$, one can determine $u_{h,\ell}^n$ from the second equation of (4.1). The iteration is terminated when the following tolerance error is reached:

$$
||H_{h,\ell}^n - H_{h,\ell-1}^n||_{L^\infty(\Omega)} < 10^{-7} \quad \text{and} \quad ||u_{h,\ell}^n - u_{h,\ell-1}^n||_{L^\infty(\Omega)} < 10^{-7},
$$

which is much smaller than the temporal discretization errors observed in our numerical results.

The number of iterations at each time level, with $\tau = 1/128$, is presented in Figure 4.1 (left), which shows that the nonlinear system can be effectively solved with a few iterations to achieve the accuracy in (4.2). The energy of numerical solutions is presented in Figure 4.1 (right), which shows that the energy decays in time, consistent with the theoretical result of Theorem 2.1.

![Figure 4.1. Number of iterations and energy at each time level.](image-url)

Since $H^2(\Omega) \hookrightarrow L^\infty(\Omega)$ in the two-dimensional space, the error estimate in Theorem 2.2 implies...
that the proposed method has second-order convergence in $L^\infty(\Omega)$. Since the exact solution is unknown, we present the $L^\infty(\Omega)$-errors of numerical solutions in Table 4.1 based on the difference between two numerical solutions using consecutive stepsizes, with a sufficiently small mesh size $h$ such that the spatial discretization error is negligible in observing the temporal convergence rates, which are computed by using the formula

$$\text{convergence rate} = \log_2 \left( \frac{\|u_{h,2\tau}^N - u_{h,\tau}^N\|_{L^\infty(\Omega)}}{\|u_{h,\tau}^N - u_{h,\tau/2}^N\|_{L^\infty(\Omega)}} \right)$$

based on the three finest stepsizes. The numerical results indicate that the proposed method has second-order convergence in time, consistent with the theoretical result of Theorem 2.2.

**Appendix: Well-posedness of the linear hyperbolic equation (3.29).** First, we prove uniqueness of the solution of (3.29) for sufficiently small $\tau$. If $w$ and $v$ are solutions of (3.29), then

(A.1) \[ \frac{2}{\tau} (w - v) + u_{n-\frac{1}{2}} \cdot \nabla (w - v) + (\nabla \cdot u_{n-\frac{1}{2}})(w - v) = 0. \]

Testing (A.1) by $w - v$ immediately yields

\[ \frac{2}{\tau} \|w - v\|_{L^2}^2 = -\frac{1}{2} (\nabla \cdot u_{n-\frac{1}{2}}, |w - v|^2) \leq \frac{1}{2} \|\nabla \cdot u_{n-\frac{1}{2}}\|_{L^\infty} \|w - v\|_{L^2}^2. \]

Hence, for

(A.2) \[ \tau \leq \frac{1}{\|\nabla \cdot u_{n-\frac{1}{2}}\|_{L^\infty}}. \]

this estimate implies $w - v = 0$.

Second, we prove existence of a solution $e_{H}^{n-\frac{1}{2}} \in H^2(\Omega)$ to (3.29). To this end, we let $g_H^n$ and $u_{n-\frac{1}{2}}$ be extended to $H^2(\mathbb{R}^2)$ and $H^3(\mathbb{R}^2)$, respectively, both with compact supports in some bounded domain $\Omega' \supset \overline{\Omega}$, and consider the viscous approximating problem

(A.3) \[ \frac{2}{\tau} v_\delta + u_{n-\frac{1}{2}} \cdot \nabla v_\delta + (\nabla \cdot u_{n-\frac{1}{2}}) v_\delta - \delta \Delta v_\delta = g_H^n \]

with a small parameter $\delta > 0$. It is well known that, for sufficiently small $\tau$, satisfying (A.2), the elliptic equation (A.3) has a unique solution $v_\delta \in H^4(\mathbb{R}^2)$. Clearly, (3.25) and (3.28) imply (A.2). Thus (A.3) has a solution $v_\delta \in H^4(\mathbb{R}^2)$ under condition (3.28).

In the following, we prove that $v_\delta$ converges strongly in $H^1(\Omega)$ and weakly in $H^2(\Omega)$ to a solution of (3.29) as $\delta \to 0$. In fact, differentiating (A.3) twice yields

\[ \frac{2}{\tau} \partial_{ij} v_\delta + u_{n-\frac{1}{2}} \cdot \nabla \partial_{ij} v_\delta + (\nabla \cdot u_{n-\frac{1}{2}}) \partial_{ij} v_\delta - \delta \Delta \partial_{ij} v_\delta = \]
Similarly, one can obtain
\[ \partial_{ij} g^n_H - \partial_{ij} u_\varphi^{n-\frac{1}{2}} \cdot \nabla \partial_{ij} v_\delta - \partial_{ij} u_\varphi^{n-\frac{1}{2}} \cdot \nabla v_\delta - (\nabla \cdot \partial_{ij} u_\varphi^{n-\frac{1}{2}}) \partial_{ij} v_\delta - (\nabla \cdot \partial_{ij} u_\varphi^{n-\frac{1}{2}}) v_\delta. \]

Then, testing this equation by \( \partial_{ij} v_\delta \), we obtain
\[ \frac{2}{\tau} \| \partial_{ij} v_\delta \|^2_{L^2(\mathbb{R}^2)} + \delta \| \nabla \partial_{ij} v_\delta \|^2_{L^2(\mathbb{R}^2)} \leq C \| g^n_H \|_{H^2} \parallel v_\delta \parallel_{H^2(\Omega')} + C \| u_\varphi^{n-\frac{1}{2}} \|_{H^3} \parallel v_\delta \parallel_{L^2(\mathbb{R}^2)}. \]

Similarly, one can obtain
\[ \frac{2}{\tau} \| v_\delta \|^2_{L^2(\mathbb{R}^2)} + \delta \| \nabla v_\delta \|^2_{L^2(\mathbb{R}^2)} \leq C \| g^n_H \|_{H^2} + (C + C \| u_\varphi^{n-\frac{1}{2}} \|_{H^3}) \parallel v_\delta \parallel_{L^2(\mathbb{R}^2)}. \]

These estimates imply
\[ \frac{2}{\tau} \| v_\delta \|^2_{H^2(\mathbb{R}^2)} + \delta \| \nabla v_\delta \|^2_{L^2(\mathbb{R}^2)} \leq C \| g^n_H \|_{H^2} + (C + C \| u_\varphi^{n-\frac{1}{2}} \|_{H^3}) \parallel v_\delta \parallel_{H^2(\mathbb{R}^2)}. \]

When \( \tau \) is sufficiently small, the last term on the right-hand side of (A.4) can be absorbed by the left-hand side. Then, we have
\[ \parallel v_\delta \parallel_{H^2(\mathbb{R}^2)} \leq C \| g^n_H \|_{H^2}, \]

with a constant \( C \) independent of \( \delta \). Hence, there exists a subsequence \( \delta_k \to 0 \) such that \( v_{\delta_k} \) converges strongly in \( H^1(\Omega) \) and weakly in \( H^2(\Omega) \) to some function, which we denote by \( e^n_{\delta} \in H^2(\Omega) \). Then, by letting \( \delta = \delta_k \to 0 \) in (A.3), we obtain that \( e^n_{\delta} \) is the solution of (3.29) on \( \mathbb{R}^2 \) (therefore it is also a solution on \( \Omega \)). Uniqueness of such a solution has already been proved.
