# Context and problem formulation

---

- ▶ **How do we represent, and visualize, the way different entities of a community evolve together over time?**
  - ▶ How do tables of a relational schema evolve together over time?
  - ▶ How do classes of an object-oriented program evolve together over time?
  - ▶ How do functions and data structures of a C program evolve together over time?
  - ▶ How do entities, controllers and views of Web application evolve together over time?
  - ▶ ....

Sort, Cluster, Find Patterns

Time as columns

# Contribution

---

- ▶ A **conceptual model** that represents the lives of co-evolving entities along:
  - ▶ A **timeline**, and a set of peer **entities**, forming a **two dimensional space** and **context** for the common life of a community, and,
  - ▶ **quantifiable measures** of activity for each of them.
- ▶ A **tool** (Plutarch's Parallel Lives) that is based on the **model** and allows a quick **understanding** (and reporting) of how the life of the **community has evolved**.
- ▶ The facilitation of the fully automated **identification of highlights, or patterns**, over the PLD.

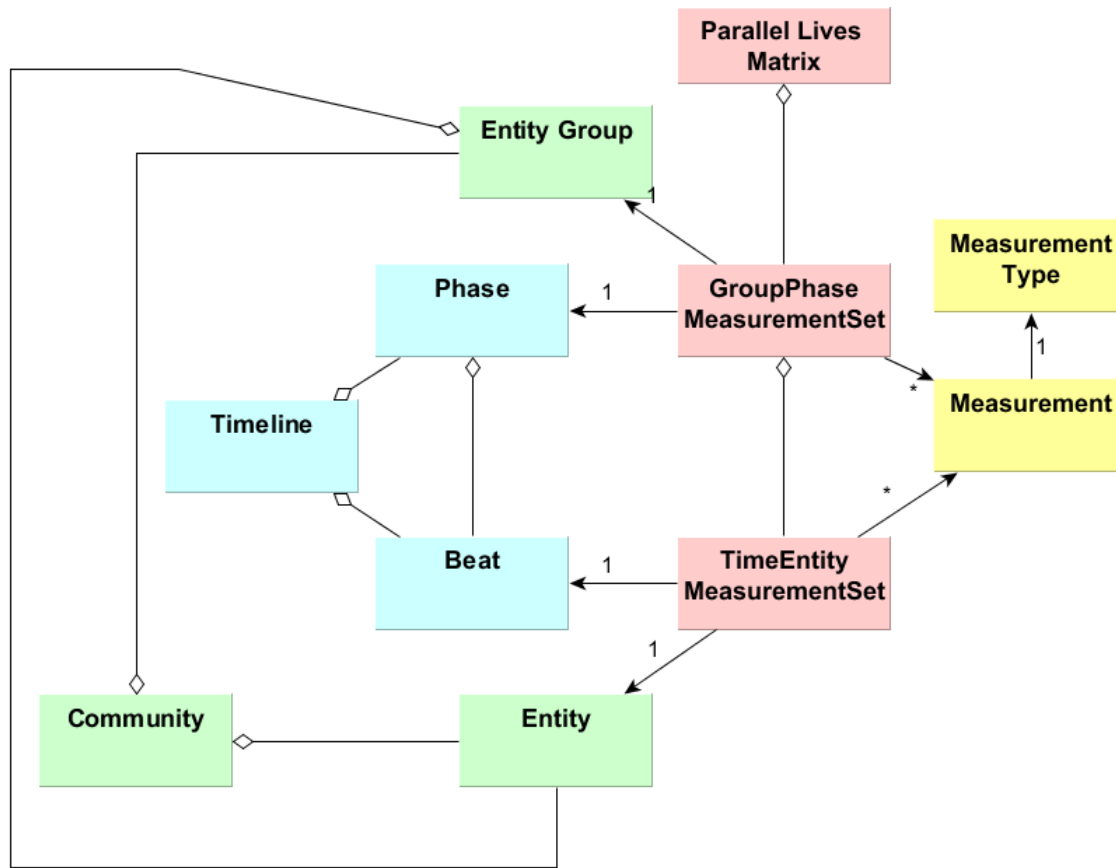

# The model

# Time Concepts

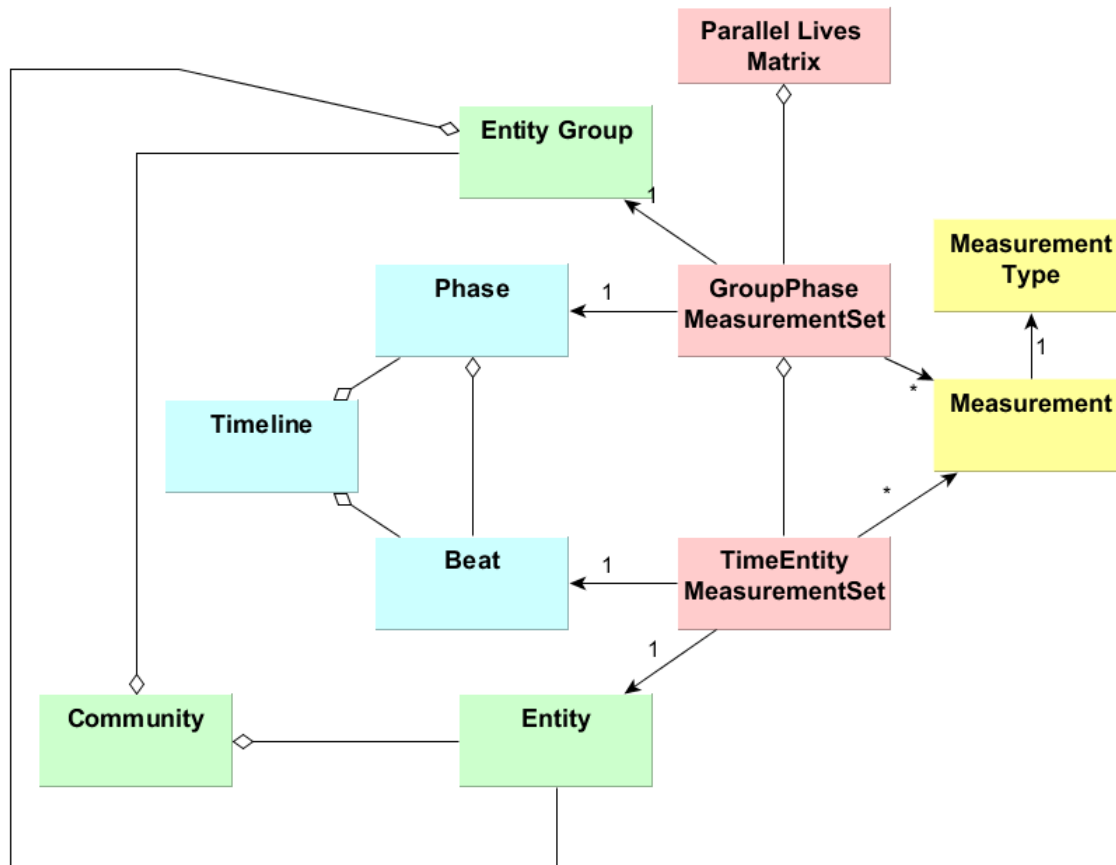

- ▶ **Beat:** individual time point granule
  - ▶ Seconds, milliseconds, commits, etc.
- ▶ **Timeline:** sequence of beats.
- ▶ **Phase:** period of time points, to allow time zoom out.
  - ▶ Roll-up of time to e.g., days or months, years, etc.

# Community Concepts

- ▶ **Entity:** individual, granular, elements.
  - ▶ A relation, a class, a function, etc.
- ▶ **Community:** set of entities, evolving together.
  - ▶ A schema, a software project, etc.
- ▶ **Entity group:** group of related entities, to allow community zoom out.
  - ▶ A package, a module, etc.

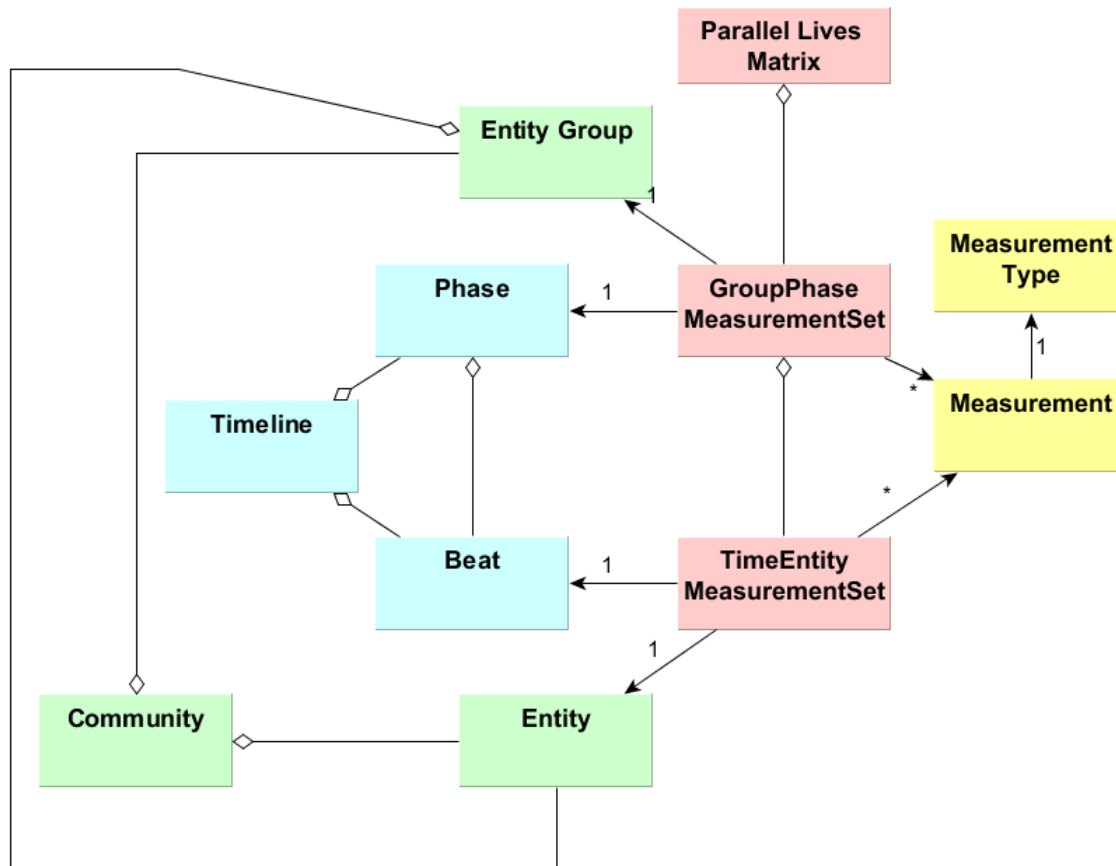

# Measurement Concepts

- ▶ **Measurement Type:** individual, granular, measurement of change
  - ▶ Number of attributes injected, deleted, updated over their data type, etc.
  - ▶ Number of lines ins/del/upd is a file.
  - ▶ Number of methods/attributes/... ins/del/upd in a class.
- ▶ **Measurement:** the number measured.

# Relations between Concepts

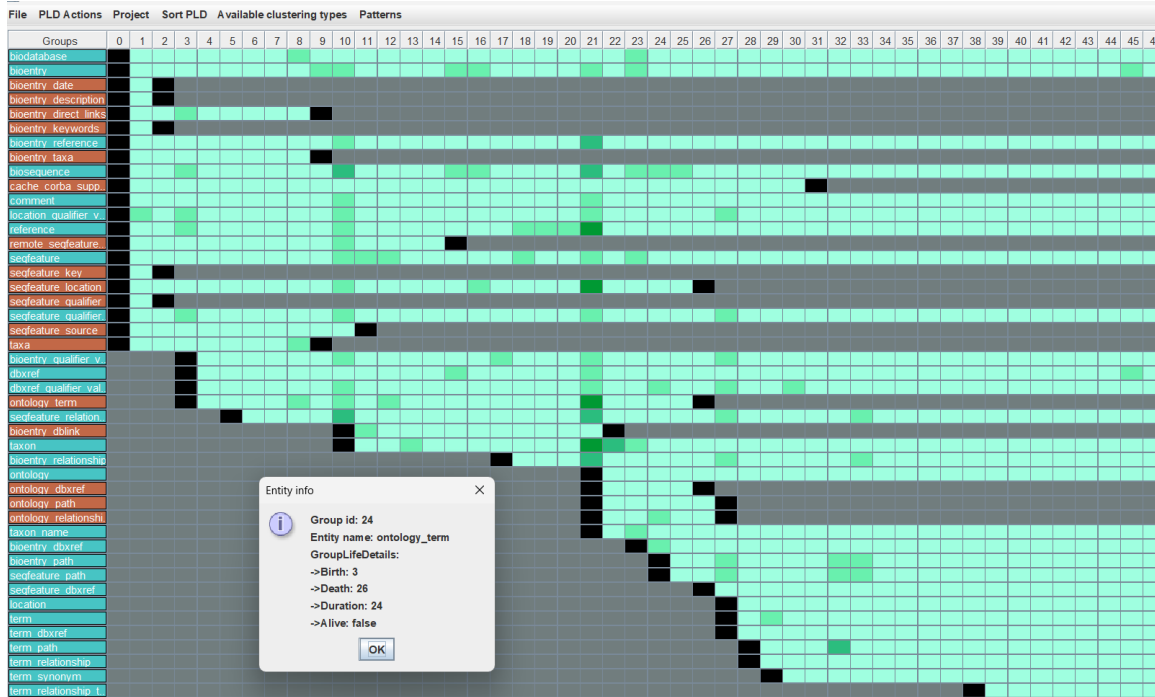

- ▶ **TimeEntityMeasurement (TEM):** relates a measurement of a certain type with a combination of entity and beat.
  - ▶ The total number of attributes changed for table Employee in 1<sup>st</sup> June 2023 was 0. (assuming day to be the time granule)
- ▶ **GroupPhaseMeasurement:** aggregate measurement for a zoomed-out context
  - ▶ The total number of attributes changed for table Employee in June 2023 was 2. (roll-up time to month)

# Parallel Lives Diagrams

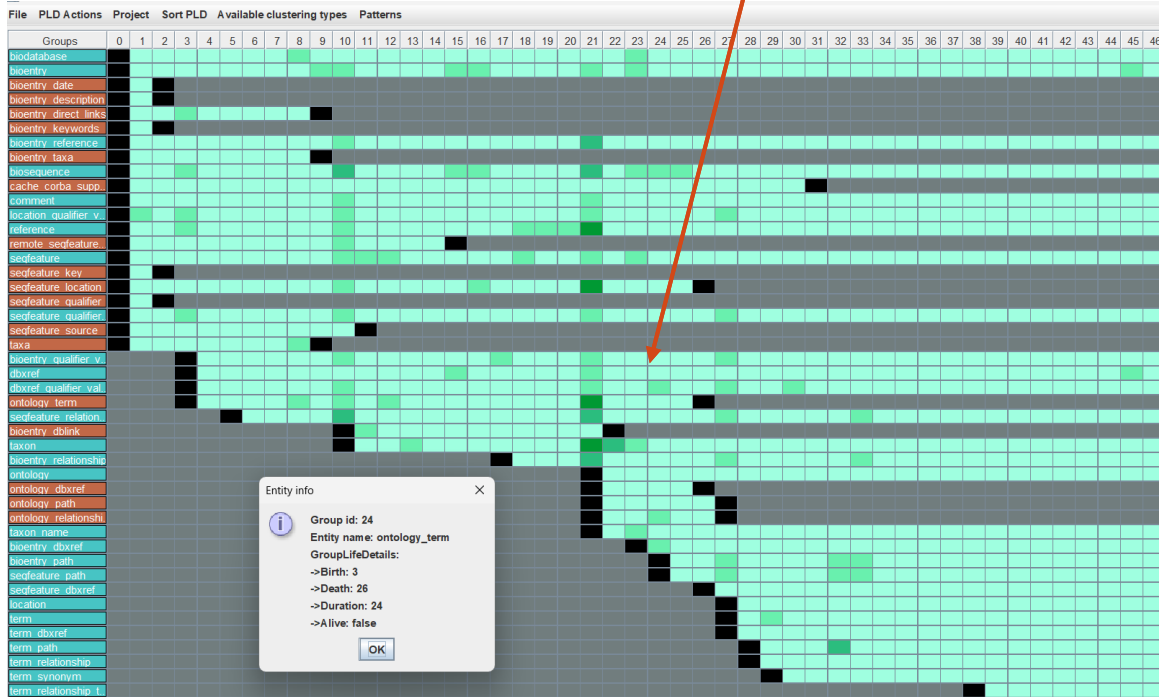

**Time \* Community create a 2D space. Each TEM is a point (aka “cell”) in the 2D space. We visualize it as a Parallel Lives Diagram**

We can tell the **story** of a **community** with a simple, intuitive, single image !!!

# TEM's have states

Every TEM  
has a **state**

**Birth:** marks the first appearance of e in the community.

**Active:** e is a member of the community and evolves overtime

**Disappearance:** e leaves community for some time.

**Inactive:** e is not a member of the community for some time.

**Rebirth:** e appears again in the community.

**Death:** e leaves the community permanently.

# The highlights

# Highlights

---

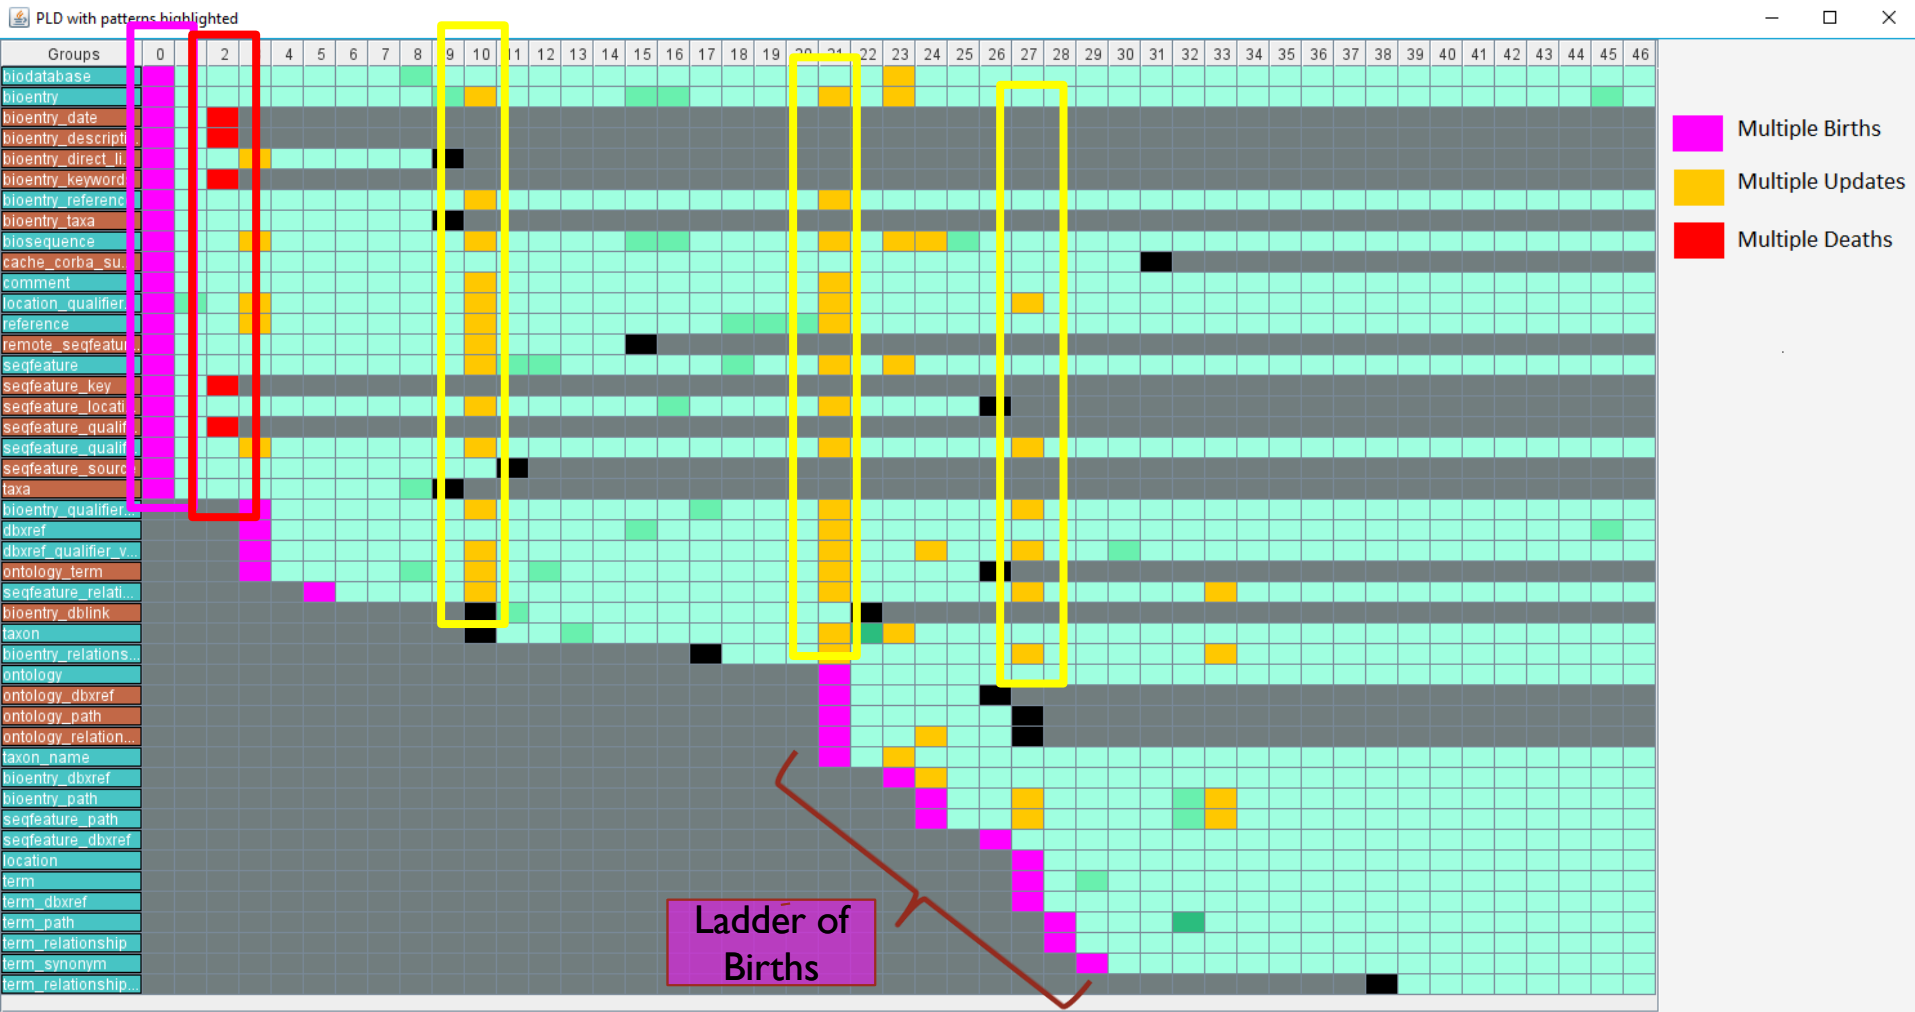

- ▶ In a PLD we can have “**areas of interest**” and “**highlights (patterns)**” in the 2D space depending on what we are looking for.
- ▶ We provide an **extensible set** of **patterns**, as well as **algorithms** to compute them.

# Several Highlights

Massive Births

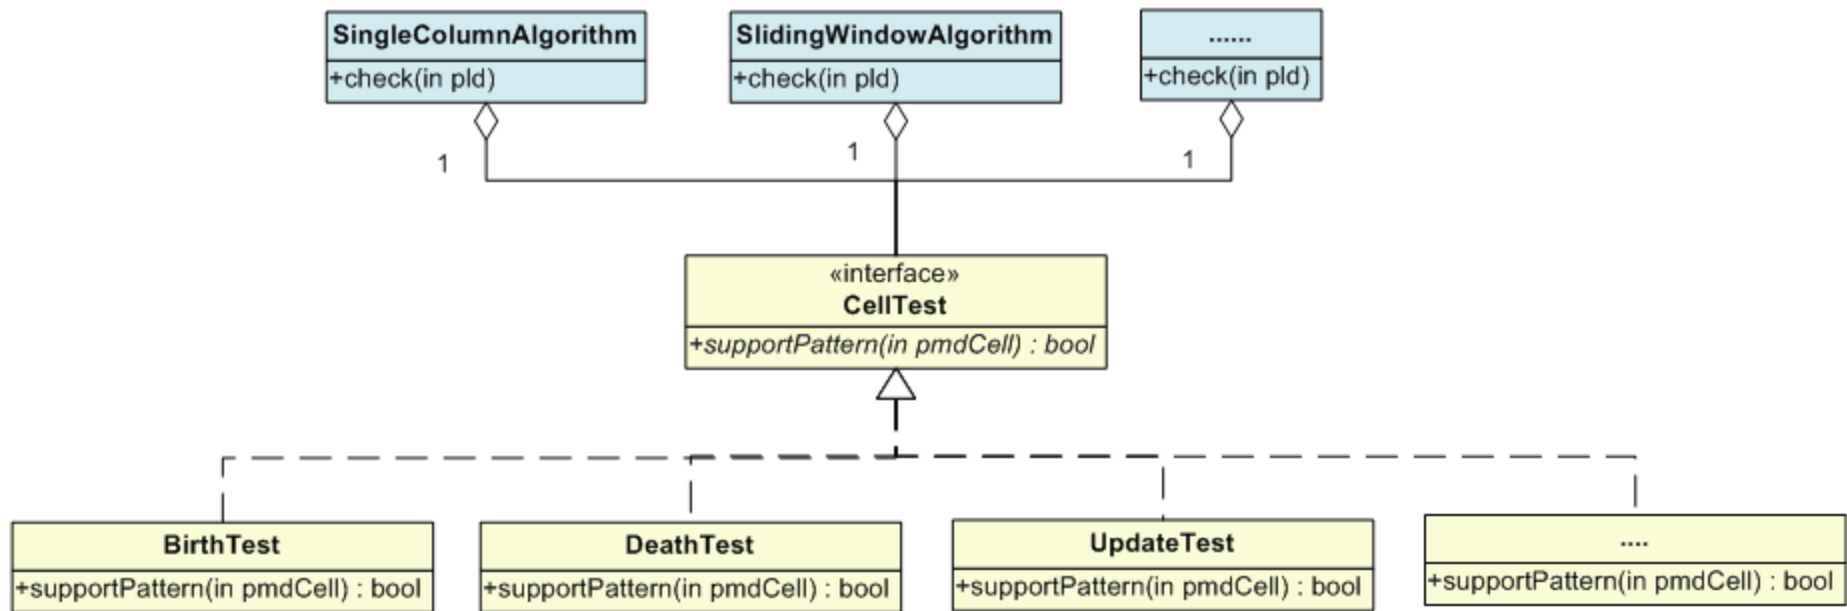

Massive Deaths

Massive Updates

# Extensible set of Algorithms

---

# A study over 195 FOSS schema histories

---

- ▶ Patterns in 62% of the schemas,
  - ▶ Mostly massive birth patterns (56%) due to big-bang schema creations.
  - ▶ Deletions are rare.
  - ▶ Progressive expansion and massive maintenance is not very frequent.

# Summary

# Parallel Lives Diagrams

---

- ▶ A **conceptual model** that involves **entities, timelines, measurements** to capture how the different entities of a community co-evolve.
- ▶ The model allows:
  - ▶ The **visualization** and intuitive **understanding** of the community evolution in a simple, but also powerful, way.
  - ▶ the **mining** of **interesting highlights** of change that highlight important points and members in the evolution of the community.
- ▶ **Future research:**
  - ▶ Easier zoom-in/out with more flexible / predefined / ... hierarchies
  - ▶ Pattern generalization – e.g., of birth staircases and massive updates to a "x changes soon after y" pattern is a simple example.
  - ▶ Automated reporting.

Thank you!

Everything is online!

Our group's git page

The screenshot shows the GitHub profile of the 'daintiness' group. The profile header includes the group name, a description 'DAta INTensive Information EcoSystemS Group', and location 'Ioannina, Greece'. Below the header, there are statistics for Repositories (12), Packages, People (4), and Projects. A search bar is present with 'Find a repository...' and filters for 'Type' and 'Language'. The main content area lists several repositories:

- PlutarchParallelLives**: This is a project for the monitoring of the evolution of the parallel histories of entities that evolve in parallel. This is a new, that builds upon the previous Plutarch\_Parallel\_Lives (attn to the underscores at the name) that visualized the schema evolution of the tables of a relational schema. Tags: visualization, java. Updated 7 days ago.
- Schema\_Evolution\_Datasets**: Forked from giskou/EvolutionDatasets. Collections of schema histories, to be studied for their schema evolution. Tags: sql, relational-databases, schema-evolution. Updated on Jan 23.
- Hecate**: Forked from giskou/Hecate. Diff visualization between 2 SQL schemas. Tags: java, relational-databases, schema-evolution. Updated on Dec 10, 2020.
- ParmenidianTruth**: Visualizes the story of a database's schema as a pptx presentation. Updated on Oct 10, 2018.
- Hecataeus**: Forked from pmanousis/Hecataeus. Database evolution what-if analysis tool. Updated on Mar 17, 2018.
